RE: The following revised work plan, dated August 11, 2009, describes the excavation work to be conducted at Former Desert Petroleum Site DP793, 4035 Park Blvd., Oakland, California 94602.

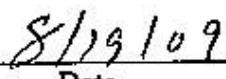

Dear Mr. Wickham:

I have reviewed the enclosed work plan that I contracted Western Geo-Engineers to prepare.

I declare, under penalty of perjury, that the information and/or recommendations contained in the attached report are true and correct to the best of my knowledge.

Sincerely,

William Thompson, Desert Petroleum, Inc.

RE: Revision of the February 6, 2006 Work Plan for site DP793 located at 4035 Park Blvd., Oakland, CA.

Dear Mr. Wickham:

INTRODUCTION

After review of the March 8, 2005 "Soil and Groundwater Investigation with Conceptual Model", Alameda County Health requested the development of the February 2006 Work Plan that would detail the execution and completion of the following tasks 1) excavation and removal of benzene contaminated soils, 2) destruction of unnecessary monitor wells, 3) further definition of the TPHg plume west of Brighton Avenue along the sewer and storm drain system and 4) construction treatment compound along with an underground lateral from the new treatment compound to the receptor trench to provide continuous pumping from trench wells T1 and T2. The tasks were designated as follows: 1) excavation and removal of benzene contaminated soils, 2) destruction of unnecessary monitor wells, 3) further definition of the TPHg plume west of Brighton Avenue along the sewer and storm drain system and 4) construction of treatment compound along with an underground lateral from the new treatment compound to the receptor trench to provide continuous pumping from trench wells T1 and T2. This work plan was approved in the April 4, 2006 Alameda County Health directive.

Tasks 2 and 3 were completed, but due to high bid cost and encroachment agreements with the City of Oakland, Task 1 and 4 have not been completed. A revised work plan to reduce the area to be excavated as outlined in Task I was submitted September 25, 2008. Mr. Jerry Wickham, Alameda County Health, did not approve the revised work plan dated September 25, 2008 stating that the revised excavation plan would not meet the objective of removing the source of contamination. This revision to the original February 2006 work plan address the above mentioned concern of excavating contaminated soils, original Task I. Due to budgetary problems, Task 4, the connection

of the receptor trench and construction of a new treatment compound will be postponed until moneys become available to proceed.

To proceed with the project, Mr. Jerry Wickham, Alameda County Environmental Health, has requested a revised proposal that address the remediation of residual soil contamination that may be present after completion of the excavation. This revised work plan outlines the changes in work associated with the original February 2006 Work Plan.

1.0 SITE LOCATION AND IDENTIFICATION NUMBERS

Former Desert Petroleum #793 is a non-active service station (USTs and associated piping removed June 23, 1994 and building demolished on April 9, 2003), located on the northwest corner of the intersection of Park Boulevard and Hampel Street at 4035 Park Blvd., Oakland, California (Figure 1). The site is located in projected section 32; T1S; R3W; MDB&M at an approximate elevation of 210 feet above mean sea level (Figure 2).

East Bay Municipal Utility District - Sewer Discharge Permit #50435501
Alameda County Local Oversight STID 1248, Fuel Leak Case No. RO0000429
San Francisco Bay Regional Board (Region 2) Case # 01-0170
Facility/Leak Site ID# T0600100158

Table 1 is a tabulation of groundwater monitoring results.

Table 2 is a tabulation of soil sample results.

Overview of Revised Work Plan

This work plan is designed to show changes in Task 1 and addresses the handling of residual (if any) soil contamination that may be present after completion of the excavation of soils contaminated with benzene (gasoline range hydrocarbons) as defined in the March 8, 2005 "Soil and Groundwater Investigation with Conceptual Model".

2.0 Local Geology and Hydrogeology of the Site

Desert Petroleum site, DP793 is situated in the Coast Ranges Province of California. The Coast Ranges are a geomorphic province that trends north-northwesterly (30 - 40 degrees west of north), paralleling the Sierra Nevada, positioned east of the Pacific Ocean and west of the Great Valley Province.

The Hayward fault is the boundary between two distinctly different geologic and physiographic provinces: the hills on the east side of the fault and the flatlands on the west side of the fault.

The groundwater basins within the Coastal Ranges are predominately unconsolidated fine to coarse grained sediments deposited by streams draining the mountain ranges.

2.1 Geomorphology/Groundwater Occurrence

The site is located on the western slope of the Berkeley Hills. The Berkeley Hills are a northwest-southeast trending range within the Coastal Range Province of California. Erosion of the Coastal Ranges has filled the valleys within and bordering the Coastal Range with sequences of gravels, silts, sands, and clays. Groundwater in this area is contained within the "East Bay Plain". The East Bay Plain groundwater basin is composed of unconsolidated, fine to coarse grained sediments deposited by streams draining the Diablo Range. Regional tectonic events and sea level fluctuations, caused by glaciation have subjected the East Bay Plain to alternating periods of marine inundation (fine sediments) and subaerial exposure (coarse sediments). A sequence of silts and clays (confining layers) and coarse-grained sediments (alluvial fans) have been deposited on top of relatively impermeable bedrock.

The area is relatively unstable, ie. plate boundary, faulting and the hills are predominately highly tilted Franciscan Assemblage, Great Valley Sequence and Miocene age sedimentary and igneous rock. During seasonal soil saturation, slump blocks and rockslides are common to the area.

Drinking water for Alameda County originates from the Sierra Nevada mountain range, but at one time the East Bay Plain was the main water supply. Currently the East Bay Plain supplies water for domestic irrigation and industrial purposes. The January 1994 Department of Water Resources Report "Ground Water Storage Capacity of a Portion of the East Bay Plain, Alameda County, California" indicates that about 2,560,000 acre-feet of groundwater is stored in the basin. Of this about 80,000 acre-feet can be safely used if water levels are maintained above sea level. The average thickness of the aquifer is approximately 50 feet, with depth to groundwater varying between 5 and 40 feet below land surface.

2.2 Stratigraphy/Groundwater Occurrence

2.2.1 Station Property

In areas that have not be previously excavated or brought to grade with rock fill, the native soil from surface to 11 feet below ground surface (BGS) consists of dark brown silty clay. The dark brown silty clay is underlain by light brown stiff clay that includes occasional subrounded to round metavolcanic and quartz gravel. This clay extends to approximately 17 feet BGS. First groundwater is found in this clayey formation between 5 and 16 feet BGS. Direct Push Core Holes (December 2004) were tested between 11 and 19 feet BGS for the occurrence of groundwater. Due to the low yield, the test holes had to be left open overnight to allow enough water to enter prior to obtaining samples. A conglomerate of brown, clayey gravels and sands extends from the base of the brown clay to approximately 33 feet BGS. The conglomerate is consolidated to semi consolidated. Direct Push Core Holes were tested for the presence of water between 24 and 30 feet BGS. Enough water entered the test hole within hours to obtain water samples. Firm brown clay underlies the conglomerate to 49.5 feet explored. Direct Push Core Holes were tested for the presence of water between 34 feet BGS and total depth. Due to low yield, these test holes were left

open overnight to allow enough water entry to obtain samples, see Figure 3 – sample and well locations.

2.2.2 Backyard Sewer Lateral Route

Assessments performed along the sewer lateral as it leaves the site and routes through the residential area towards Brighton Avenue show the subsurface to consist of fill from a couple of inches thick to two feet thick. Beneath the fill is a sequence of clay formations that vary from light brown to dark gray to approximately the 6 foot depth. Silty clay then extends to approximately the 14-foot depth. Beneath the silty clay is sand with occasional gravel (conglomerate). This sand is 11 feet thick at RS5 and is underlain by silty clay.

Hand augured borings were used to install temporary piezometers to perform "time recharge" slug tests of the shallow groundwater beneath the backyards near the sewer lateral route. These borings, B1, B2, B3, B4 and B5 were installed May 1996. Using the Bouwer and Rice Slug Test Model, hydraulic conductivity was calculated for each boring. Boring B4 did not produce enough water that day to perform the test. Depth to water measurements along with top of piezometer elevation level were used to determine gradient. The resulting groundwater velocities ranged from a low of 4.1 feet/year at BH1 to a high of 385 feet/year at BH5. Soil samples from these borings were analyzed for total organic carbon (TOC). Utilizing the TOC (340 - 5700 mg/Kg) amounts the retarded velocity for each borehole was then calculated for BTEX. Benzene in groundwater has a retarded velocity ranging from 2.98 feet/year at BH1 to a high of 70 feet/year at BH5, see July 3, 1996 Western Geo-Engineers report "Sewer Lateral Investigation Report Desert Petroleum Station #793, 4035 Park Boulevard, Oakland, CA."

2.2.3 Brighton Avenue

Construction of the receptor trench along the eastern curb area of Brighton Avenue revealed two separate sequences of lithology. North of the storm drain catch basin the sequence consists of; clay to the four foot depth, silty clay to the seven foot depth, fine silty sand to the 9 foot depth, medium sand to the 10 foot depth, silty clay to the 11 ½ foot depth, gravel to the 12 foot depth, underlain by clay to the 16 foot depth. South of the storm catch basin is a sequence of silty clays and clays to the 10 foot depth.

A more sandy sequence of sediments north of the storm water catch basin at Brighton Avenue, as compared to the sediments south of the storm water catch basin, indicate a facies change or a fault remnant striking east/west near the storm drain catch basin. A topographic lineation along the 200 foot contour is located in this area, see Figure 2.

2.2.4 Groundwater

Groundwater movement has been documented by depth to water measurements of the existing groundwater monitoring wells associated with this investigation, see Table 1. The groundwater flows west, northwest from the site towards the topographic low, receptor trench, along Brighton Avenue. During precipitation events infiltration to the area on site that has been over-excavated and then backfilled with pea gravel and road base becomes a groundwater high. Pumping from on

site well RS5 has created a depression, cone, at RS5 with influence out to down gradient wells RS8 and RS10.

WORK PLAN PROCEDURES (TASKS)

This revised work plan addresses changes in Task 1, remove (excavate) soils contaminated with benzene (gasoline range hydrocarbons). The original cost to perform contaminated soil removal/disposal of approximately 1400 cubic yards of \$470,000 (\$200,000 for shoring) with a total cost to complete Tasks 1 and 4 at \$580,500.00, was rejected as excessive by Desert Petroleum. This subsequent more focused excavation plan would utilize benching/sloping of the sidewalls to alleviate the need for shoring. Other elements of change are the necessities to destroy monitor well RS 5 prior to excavating (this well is situated within the excavation area) and the installation of a well (EX) within the excavation for future groundwater recovery and if necessary vapor recovery. The State UST Fund in their 5-year review summary dated June 15, 2009 concurs with Alameda County LOP to precede with the remediation (Excavation of contaminated soils). The following describes the changes in the excavation plan, Task 1.

Task 1, remove (excavate) soils contaminated with benzene (gasoline range hydrocarbons).

Task 1 - Excavation/Backfill

(Changes are bold and italic)

The February 2006 Work Plan estimated that approximately 700 cubic yards of clean overburden (8 to 10 foot depth) needed to be removed and stockpiled on site prior to removal of gasoline contaminated soil. This has not changed. MaCoy Corp. anticipated that shoring would be necessary and would encompass the entire excavation at a cost of approximately \$200,000.00. This jumped the excavating/backfilling cost to \$462,000.00. The request for bid was revised with sloping/benching. MaCoy Corp. did not respond. RAH Environmental responded and has been selected to perform the work. *With the use of sloping/benching shoring will not be necessary. A dewatering well was to be placed at the extreme northwest corner of the excavation. This well will now be placed at the southwestern edge of the excavation and will be a dual purpose (water recovery and if necessary vapor recovery), see well design details, Figure 5.* Groundwater entering the excavation would be pumped to a holding tank (allowing solids to settle) prior to being pumped to the existing water carbon treatment system for disposal to the sanitary sewer under East Bay Municipal Utility District Wastewater Discharge Permit No 50435501 which allows a continuous discharge of 5 gpm to sewer. *Under this revised work plan dewatering of the excavation will utilize the excavation well EX, monitor well RS05 will be destroyed prior to start of excavation work.* The excavation is designed to remove contaminated soils down to a total depth of between 30 and 35 feet. *At total depth (anticipated at or near 32 feet below the surface) the excavation will slope downward to the dewatering/vapor recovery well (EX), see Figure 4.* Confirmation soil samples will be obtained from the sidewalls and base of the excavation prior to any backfilling. The above mentioned shoring would have made obtaining sidewall samples impossible. *The excavated contaminated soil will be segregated into two piles. Pile A will be comprised of soils of noted field screened positive responses to a photo ionizing detector (PID)*

with a 10.6 ev bulb. This pile once completed will be sampled and profiled and disposed of at a Class II landfill. Pile B will be comprised of soils of questionable field screened responses to the PID. Pile B will be sampled to determine if this soil can be left on site or qualifies for aeration. Both piles will be placed upon and covered with plastic liner when not being sampled or added to. Once the excavation has been completed a 4 inch PVC well (dewatering well) would be permanently placed for future groundwater/vapor removal. This excavation well (EX) will be placed into the excavation prior to backfilling. The excavation well will be constructed of schedule 40 PVC with 0.02 slot from total depth to the 12 foot depth, with blank casing to surface. One inch diameter drain rock will be placed into the excavation to the 12 foot depth and compacted. Geofabric will be placed over the drain rock to prevent fine material from invading the drain rock. Clean road base will then be compacted in two foot lifts from the 12 foot depth to the 8 foot depth. Then the previously removed clean overburden will be compacted in 2 foot lifts to surface. *Temporary 2 inch diameter Sch 40 PVC pipe will connect the well head T for future vapor extraction source test.* Once the new treatment compound is completed, above ground steel piping will be used to connect the excavation well traffic rated vault (24" width X 24" deep) to the treatment compound. This vault will be secured slightly above grade $\frac{1}{2}$ " in a concrete form. The treatment compound is to be moved to the Park Avenue side of the lot so the current owner can develop the property as part of Task 4, see Figure 4

for proposed siting. This will allow easy access for operations and maintenance of the groundwater pump and treatment system.

RS5 Destruction, Well EX installation

Conversations with James Yoo, Alameda County Public Works, indicate that well RS5 can be destroyed using tremie pipe placement of neat cement with 5% bentonite. Once the well has been destroyed the traffic box will be removed during the excavation process. Well destruction permit will be obtained from Alameda County Public Works. After completion of the excavation work, excavation well EX will be installed at the southwest corner of the excavation prior to backfilling. A well completion permit will be obtained from Alameda County Public Works.

Report of Findings

At completion of the excavation backfill and upon receipt of the documentation soil samples a report of findings will be provided. This report will contain at a minimum figures showing the exact dimensions of the excavation showing sample locations, ID and depth. Cross section views detailing the excavation and backfill levels and type. Table of soil sample results. Discussions of procedures detailing the excavation, sampling, stockpiling of soils, air monitoring, dust and sediment controls and soil sample results. Recommendations on further work if necessary and summary of events.

Vapor Extraction Source Test

After completion of the excavation backfill a vapor extraction source test will be conducted using the excavation well (EX) as the vapor recovery well.

EX well will be fitted with a 4" to 2" T with air tight cap. Two inch diameter schedule 40 PVC pipe will connect the 2 inch portion of the well cap T to a 115 volt explosion proof blower that is capable of non restricted flow of 100 cfm. The exhaust of the blower will be connected to an orifice flow/sample manifold that in turn connects to four in series vapor carbon canisters. Sample ports will be positioned on the orifice flow/sample manifold and the exhaust of each carbon canister.

The vapor extraction source test will be conducted for five days. Influent samples will be obtained at the initial start of the test and every day following the start up with the final influent sample being obtained just prior to termination of the test. The samples will be obtained in certified clean Tedlar bags supplied by Kiff Analytical.

Effluent samples will be obtained each day with the final effluent sample being obtained just prior to termination of the test.

Field measurements will consist of vapor stream temperature, orifice differential in inches of water, total pressure at the blowers exhaust and photoionizing detector (PID) with 10.6 ev bulb measurements of the pump effluent, and carbon canisters effluent. If PID responses exceeds 10 ppmv at the exhaust of the last carbon canister the system will be shut off and the vapor extraction source test terminated, see Figure 6 – schematic of vapor extraction source test system.

All vapor samples will be chain of custody (COC) delivered to Kiff Analytical, for analysis of TPHg, Benzene, Toluene, Ethylbenzene, Xylenes and MtBE.

At the completion of the source test a report will be provided detailing the events of the source test, laboratory analysis, flow and temperature readings and pounds per day removal of the analytes of concern; TPHg, BTEX and MtBE. This report will also include the risk analysis of any residual contaminates that may have been left after completion of the excavation.

Vapor Recovery System Monitoring and Sampling

INFLUENT SAMPLE

The influent sample is obtained from a sample port located at the inlet of the first vapor phase carbon unit. Sample ports are situated at the inlets of all carbon units and at the exhaust stack. Sterile poly tubing is then used to attach the inlet sample port of the first carbon unit to the tedlar bag. The tubing is purged with the vapor stream prior to placing the tedlar bag to the tubing. A 1 liter tedlar bag, fitted with a special septum "valve" and tubing bib, is placed within an air tight sample port and the port is opened. The carbon units are on the pressure side of the vacuum blower allowing samples to be obtained once the sample ports are opened. Once the tedlar bag is filled, its valve is closed and locked and the appropriate label is placed on the tedlar bag.

EFFLUENT

A sample port for the effluent of each carbon unit is located at the inlet of the next in series carbon unit and the exhaust stack. The flow pressure from the exhaust is great enough to fill a tedlar bag. Sterile poly tubing is fitted to the exhaust port and the tedlar bag. Then the sample valve of the tedlar bag is opened and the bag is filled with the sample. Once the tedlar bag is full, the valve is closed and locked, the sample port closed, and the appropriate label is placed on the bag.

The labels for both the influent and effluent tedlar bag samples show the date, time, sample ID# and analyses to be run.

Both the influent and effluent tedlar bag samples are placed within a cooler, and are hand delivered to Kiff Analytical laboratory that same day.

Kiff Analytical laboratory analyzes the vapor samples for TPHg (Total Petroleum Hydrocarbons, gasoline), BTEX (benzene, toluene, ethylbenzene, and xylenes) and MtBE (Methyl tert Butal Ether) concentrations.

CALCULATIONS

VAPOR EXTRACTION TPHg REMOVED IN POUNDS PER DAY

To calculate the pounds (lb) per day the concentration is multiplied by the volume of air produced in one day.

The lab reports the Concentrations (C) of the air sampling in ug/liter. The first step is to convert this value to lbs/cf (pounds per cubic foot). $1 \text{ ug/l} \times 0.000001 \text{ g/ug} \times 0.0022051 \text{ g/l} \times 28.321 \text{ cf} = 0.000000624 \text{ lb/cf}$

The volume of air produced in one day equals the flow rate (Q) x the time of flow.

$$V = Q \times T = \text{cf/day} = \text{cf/min} \times 1440 \text{ min/day}$$

The volume must be corrected to standard temperature and pressure (STP).

P = Pressure = 14.7 lb/in² @ STP V = Volume cf T = Temperature in degrees above absolute Zero = 491.58°R @ STP.

Using the Ideal Gas Law $P_1V_1/T_1 = P_2V_2/T_2$

Solving for $V_2 = P_1V_1T_2/P_2T_1$

Assuming $P_1 = P_2 = 14.7 \text{ lb/in}^2$, P cancels from the equation leaving $V_2 = V_1T_2/T_1$.

$V_1 = Q \text{ cf/m} \times 1440 \text{ min/day}$ $T_2 = 491.58^\circ\text{R}$ $T_1 = 459.58 + T^\circ\text{F}$ at site. $V_2 = Q \text{ cf/min} \times 1440 \text{ min/day} \times 491.58^\circ\text{R}/(459.58 + T^\circ\text{F})$

$X \text{ lb/day} = C \text{ ug/l} \times 0.000000621 \text{ lb l/ug cf} \times Q \text{ cf/min} \times 1440 \text{ min/day} \times 491.58^\circ\text{R}/(459.58 + T^\circ\text{F})$

NOTIFICATIONS

Upon approval of this revision to the February 2006 Work Plan, a 48-hour notice will be given to all concern parties including USA (Underground Service Alert) prior to start of any site activities.

LIMITATIONS

The information presented in this report is based on the following:

1. The observations and data collected by field personnel.
2. The result of laboratory analyzes performed by a state certified analytical laboratory.
3. Our understanding of the regulations of Alameda County, the City of Oakland and the State of California.
4. References reviewed for this report.

Changes in groundwater conditions can occur due to variations in rainfall, temperature, local and regional water use and local construction practices. In addition, variations in the soil and groundwater conditions could exist beyond the points explored in this investigation.

State Certified Laboratory analytical results are included in this report. This laboratory follows EPA and State of California approved procedures; however, WEGE is not responsible for errors in these laboratory results.

The services performed by Western Geo-Engineers, under California Registered Geologist #3037, are conducted in a manner consistent with the level of care and skill ordinarily exercised by members of our profession currently practicing under similar conditions in the State of California, the City of Oakland and Alameda County.

Our work and/or supervision of remediation and/or abatement operations, active or preliminary at this site is no way meant to imply that we are owners or operators of this site. Please note that the known contamination of soil and/or groundwater must be reported to the appropriate agencies in a timely manner. No other warranty expressed or implied is made.

Sincerely yours,

A circular registered geologist stamp with the words "REGISTERED GEOLOGIST" around the top edge and "CALIFORNIA" at the bottom. Inside the circle, it says "JACK E. NAPPER" and "No. 3037". Below the stamp is a handwritten signature in blue ink that appears to be "Jack E. Napper". Underneath the signature, the text "Jack E. Napper" and "Ca. Reg. Geologist #3037" is printed in a smaller font.

George Converse
Project Geologist
