**RE: RESPONSE TO QUESTIONS IN REGARD TO THE RISK ASSESSMENT PERFORMED  
\* FOR THE ULTRAMAR, INC., BEACON GAS STATION NO. 604, 1619 WEST FIRST  
STREET, LIVERMORE, CA.**

Dear Ms. Logan:

During a telephone conversation on January 27, 1998, you requested a response to several questions concerning the above mentioned site. The following is the list of questions, as understood by BDM, and the responses provided by Mr. Leon Crain and myself.

**1. What is the zoning classification for the Beacon Gas Station No. 604?**

The zoning for the Beacon Gas Station No. 604 property is classified as "Outer Core Area" (OCA). On the basis on a discussion with personnel from the City of Livermore Planning Department, the OCA designation is a ~~commercial zone~~ classification supportive of the downtown commercial businesses.

**2. How was the groundwater concentrations for the chemicals of concerned calculated for application to the risk evaluation? Use an average value for all of the monitoring wells (in the hydrocarbon plume), the concentrations for each well should be first averaged over the four most recent quarterly sampling events.**

The source area dissolved hydrocarbon concentrations in the groundwater used for the risk assessment were taken from the most recent sampling event for MW-2 (benzene, toluene) and MW-6 (ethylbenzene, xylenes). It is the opinion of BDM that any calculation of hydrocarbon concentration using historic data would not accurately reflect the current conditions due to the success of the groundwater remediation operation.

At your request I have recalculated the source area dissolved hydrocarbon concentration by averaging the last four sampling events from each monitoring well and then averaging all for the monitoring wells within the hydrocarbon impact plume (defined by EPA MCL of benzene). The results of this calculation are provided on Table 1.

**Table 1**  
**CHEMICALS OF CONCERN**  
**Source Area Concentrations**

Hydrocarbon Constituents	Surface Soil (mg/kg)	Subsurface Soil (mg/kg)	Groundwater (mg/L)
<b>Aromatic Volatiles (8020)</b>			
Benzene	NA	20.9	2.16
Toluene	NA	160	1.05
Ethylbenzene	NA	110	0.55
Xylenes	NA	700	2.86

NA No surface soil samples recovered.

Subsurface concentrations based on sample recovered from former gasoline tankhold at 19 feet BGS and remediation system installation.

Groundwater concentrations base on March 1997 samples recovered from MW-2 and MW-8.

**3. Why wasn't the "current indoor inhalation of VOC's" exposure route evaluated for the residential dwelling located 2,700 feet down gradient from the site?**

Two current residential receptor pathways were used in the risk evaluation. A resident located 2,700 feet down gradient was used to evaluate the "ingestion of groundwater" and "dermal contact" (while showering) pathways because a water well which may be partially completed in the impacted zone is present at that location. The risk assessment does not take into account exposure to vapors from the groundwater due to water use such as residential ingestion and showering. An assumption is made that the chemical intake calculated for ingestion and dermal contact pathway is conservative enough to take into account any additional risk due to inhalation of vapors during these activities.

A resident located 1,800 feet down gradient was used to evaluate the "indoor inhalation of vapors from the groundwater" pathway, because it is the nearest current down gradient resident relative to the source area. For this reason chemical intake from indoor inhalation of vapors are greater (more conservative) than the chemical intake from indoor inhalation of vapors at the resident located 2,700 feet from the source area.

**4. Why wasn't the "current indoor inhalation of VOC's" exposure route evaluated for the on-site commercial building (Beacon Gas Station building)?**

The "current indoor inhalation of VOC's" exposure route for the Beacon Gas Station building was not evaluated because it is up gradient from the source area (as is the nearest residential dwelling to the south of the source area). Based on the laboratory results from MW-1 it is believed that the groundwater plume does not extend below the building.

**5. What is the average depth to groundwater and the average gradient at the site?**

The average depth to groundwater fluctuates seasonally from approximately 33 feet near the end of the summer to approximately 22 in the early spring. The groundwater gradient, however, remains fairly consistent at 0.006 to 0.013 feet per foot to the north-northwest.

**6. What default values were used in the risk assessment calculations?**

The default values used to calculate the exposure point concentrations from the equations provided in Section 3.0 of the Risk Assessment portion of the report are found on Table 4 (Page 12 and 13). They are also provided with the spreadsheets in Appendix B (see attachments).

The exposure parameter default values used to calculate the exposure risk from the equations provided in Section 4.0 of the Risk Assessment portion of the report are found on Table 6(a) and 6(b) (Page 16 and 17). They are also provided with the spreadsheets in Appendix C (see attachments).

**7. Re-evaluate risk using different source area dissolved hydrocarbon concentrations (question No. 2) and the California slope factors for benzene (EPA values × 0.29).**

The risk assessment re-calculation utilizes the following critical toxicity values. These values are lower than the critical toxicity values used in the original evaluation:

**Critical Toxicity Values used in the Quantitative Risk Evaluation**

Chemicals	Benzene	Toluene	Ethylbenzene	Xylenes
<b>Reference Dose</b>				
RfD <sub>o</sub>	—	0.20	0.10	2.0
RfD <sub>i</sub>	0.0017	0.40	1.0	0.086
RfD <sub>d</sub>	—	0.16	0.097	1.84
<b>Slope Factor</b>				
SF <sub>o</sub>	0.0084	--	--	--
SF <sub>i</sub>	0.0084	--	--	--
SF <sub>d</sub>	0.0087	--	--	--

✓ Appendix A includes the RBCA tool kit spreadsheets that were used to calculate only the down gradient change in hydrocarbon concentrations for the off-site exposure pathways that require fate and transport modeling (Domenico). — DAT

✓ Appendix B includes the spreadsheets that calculate the surface vapor concentrations from the soil and groundwater at the source area and at all potential down gradient exposure points. The results of these calculations are provided on Table 5. — for what risk — indoor/outdoor?

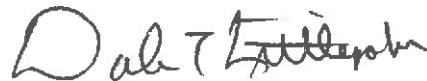

✓ Appendix C includes the spreadsheets that calculate the chemical intake from ingestion and dermal contact using the exposure point concentrations from the source area and down gradient from the source area

(determined by the Domenico model). It also calculates the chemical intake from vapors determined in Appendix B and applies the critical toxicity values to calculate carcinogenic and non-carcinogenic risk.

The results of the risk assessment re-evaluation have been provided on Table 8(a) and 8(b). These results should be compared to the original evaluation on pages 19 and 20 of risk assessment report. Generally, the carcinogenic risks to current and future receptors is lower and the non-carcinogenic risks are slightly higher. The maximum hazard quotient calculated at the site (22.8) and the maximum carcinogen risk ( $7.65 \times 10^{-5}$ ) is associated with a potential future commercial receptor (enclosed-space). Site-specific Target Levels (SSTL) for the chemicals responsible for these values have been calculated and provided in Appendix C-4. On the basis of these results, it is believed that the recommendations provided in the original report remain valid.

Please feel free to call me if you have any further questions concerning this assessment or other activities performed at the site.

Sincerely,  
BDM International, Inc.  
Environmental Services Unit

Dale T. Littlejohn, CAPM  
Senior Geologist, Director

## RBCA SITE ASSESSMENT

## Tier 2 Worksheet 8.1

Site Name: Beacon No. 604 (1800 feet)

Site Location: Livermore, CA

Completed By: Dale Littlejohn

Date Completed: 1/29/1998

6 OF 6

## TIER 2 EXPOSURE CONCENTRATION AND INTAKE CALCULATION

## GROUNDWATER EXPOSURE PATHWAY

## (CALCULATED EXPOSURE PATHWAYS)

## MAX. PATHWAY INTAKE (mg/kg-day)

(Maximum intake of active pathways  
soil breathing & groundwater routes.)

Constituents of Concern	Exposure Concentration					Off-Site Commercial
	1) Source Medium	2) NAF Value (dim) Receptor	3) Exposure Medium	4) Exposure Multiplier (IRxEFxED)/(BWxAT) (L/kg-day)	5) Average Daily Intake Rate (mg/kg-day)	
Benzene	2.2E+0		Off-Site Commercial	9.9E-3	3.5E-3	3.5E-5
Ethylbenzene	5.5E-1		Off-Site Commercial	2.5E-3	9.8E-3	2.5E-5
Toluene	1.1E+0		Off-Site Commercial	4.8E-3	9.8E-3	4.7E-5
Xylene (mixed isomers)	2.9E+0		Off-Site Commercial	1.3E-2	9.8E-3	1.3E-4
						Off-Site Commercial
						3.5E-5
						2.5E-5
						4.7E-5
						1.3E-4

NOTE: AT = Averaging time (days)

BW = Body Weight (kg)

POE = Point of exposure

CF = Units conversion factor

EF = Exposure frequency (days/yr)

ED = Exp. duration (yrs)

IR = Intake rate (L/day or mg/day)

## RBCA SITE ASSESSMENT

## Tier 2 Worksheet 8.1

Site Name: Beacon No. 604 (2700 feet)

Site Location: Livermore, CA

Completed By: Dale Littlejohn

Data Completed: 1/29/1998

6 OF 6

## TIER 2 EXPOSURE CONCENTRATION AND INTAKE CALCULATION

## GROUNDWATER EXPOSURE PATHWAYS

(CHECKED BY PATHWAY INACTIVE)

## GROUNDWATER: INGESTION

Constituents of Concern	Exposure Concentration					MAX. PATHWAY INTAKE (mg/kg-day) (Maximum intake of active pathways soil leaching & groundwater routes.)
	1) Source Medium	2) NAF Value (dim)	3) Exposure Medium	4) Exposure Multiplier	5) Average Daily Intake Rate	
	Groundwater Concentration (mg/L)	Receptor	Groundwater: POE Conc. (mg/L) (1)(2)	(IRxEFxED)(BW/AT) (L/kg-day)	(mg/kg-day)	Off-Site Commercial
Benzene	2.2E+0		4.9E+2	4.4E-3	3.5E-3	1.5E-5
Ethylbenzene	5.5E-1		4.9E+2	1.1E-3	9.8E-3	1.1E-5
Toluene	1.1E+0		4.9E+2	2.1E-3	9.8E-3	2.1E-5
Xylene (mixed isomers)	2.9E+0		4.9E+2	5.8E-3	9.8E-3	5.7E-5
						Off-Site Commercial
						1.5E-5
						1.1E-5
						2.1E-5
						5.7E-5

NOTE: AT = Averaging time (days)

BW = Body Weight (kg)

POE = Point of exposure

CF = Units conversion factor

EF = Exposure frequency (days/yr)

ED = Exp. duration (yrs)

IR = Intake rate (L/day or mg/day)
