**Re: SEMI-ANNUAL SUMMARY REPORT
THIRD QUARTER THROUGH FOURTH QUARTER 2010**
Fuel Leak Case No. RO000436

Dear Mr. Wickham:

Due to global rebranding, as of January 5, 2011 Delta Consultants has become Antea Group. Any reports submitted prior to this date will still be referenced as Delta reports.

On behalf of ConocoPhillips (COP), Antea Group (Antea) is submitting this *Semi-Annual Summary Report – Third Quarter through Fourth Quarter 2010* and forwarding a copy of TRC Solutions, Inc. (TRC's) *Groundwater Monitoring Report - October through December 2010*, dated January 17, 2010, for the following location:

<u>Service Station</u>	<u>Location</u>
Former 76 Station No. 4186	1771 First Street Livermore, California

Sincerely,
ANTEA GROUP

A handwritten signature in blue ink that reads "James B. Barnard".

SEMI-ANNUAL SUMMARY REPORT
Third Quarter through Fourth Quarter 2010
Former 76 Station No. 4186
1771 First Street
Livermore, Alameda County, California

SITE DESCRIPTION

The site is located on the southwest corner of the intersection of First Street and N Street, and is currently an active Chevron service station. Two 10,000-gallon gasoline underground storage tanks (USTs), four dispenser islands, and a station building are present at the site. The site is located in a generally commercial area.

PREVIOUS ASSESSMENT

In June 1996, during dispenser and piping replacement activities, six soil samples were collected beneath the dispensers and product piping. Total petroleum hydrocarbons as gasoline (TPHg) and benzene, toluene, ethyl-benzene and total xylenes (BTEX) were below the laboratory's indicated reporting limits in all of the samples collected and submitted for analysis.

In September 1997, a soil gas survey was conducted at the site. Six soil gas probes were advanced and samples were collected at 3 or 15 feet below ground surface (bgs) in the vicinity of the USTs, dispenser islands, and product lines. TPHg was reported in the samples at concentrations ranging from 41 to 4,500 parts per billion by volume (ppbv), benzene was reported at concentrations up to 110 ppbv, and methyl tertiary butyl ether (MTBE) was reported at concentrations up to 8,000 ppbv. The highest concentrations were reported in the area of the USTs.

In June 1998, three groundwater monitoring wells (U-1 through U-3) were installed at the site to depths of 34 feet bgs. TPHg, benzene, and MTBE were below the laboratory's indicated reporting limits in soil samples collected from the well borings.

A site conceptual model (SCM) was completed for the site in May 2000. The groundwater flow velocity was calculated to estimate plume travel time to the nearest down-gradient receptor. Groundwater velocity was calculated to be 46 feet per year. It was concluded that hydrocarbon impact to groundwater appears to fluctuate with the rise and fall of the groundwater surface beneath the site.

In February 2001, two additional monitoring wells (U-4 and U-5) were installed. The monitoring wells were installed to depths of 45 feet bgs (U-4) and 47 feet bgs (U-5). TPHg, BTEX, and MTBE were below the laboratory's indicated reporting limits in soil samples collected from the well borings. TPHg and benzene were below the laboratory's indicated reporting limits in the initial groundwater samples collected from monitoring wells U-4 and U-5; however, MTBE was reported at concentrations of 38.2 and 55.4 micrograms per liter ($\mu\text{g}/\text{L}$), respectively.

In December 2001, two additional monitoring wells (U-6 and U-7) and eight ozone injection sparge wells (SP-1 through SP-4, SP-5/5S, SP-6S, SP-7S, and SP-8/8S) were installed at the site. The monitoring wells were installed to 45 feet bgs. The sparge points in wells SP-1 through SP-4 were installed to a depth of 45 feet bgs. The sparge points in wells SP-6S and SP-7S were installed to a shallower depth of 25 feet bgs. The remaining two sparge wells each contained dual-nested sparge points installed to 25 feet bgs (SP-5S and SP-8S) and 45 feet bgs (SP-5 and SP-8). An ozone microsparge system was then installed and began operation in December 2001. The system injected ozone into the 10 sparge points.

In April 2006, seven borings (B-1 through B-7) were advanced at the site. Three boreholes were advanced at each boring location. The initial borehole was advanced to record a cone penetrometer (CPT) log of subsurface lithology. The second borehole was advanced for the purpose of collecting soil samples for observation and laboratory analysis, and to collect

discrete groundwater samples at depths of approximately 38 feet to 44 feet bgs. The third borehole was advanced to collect a discrete groundwater sample at approximately 57 feet to 65 feet bgs. Three general stratigraphic zones were identified: an upper zone from 36 to 43 feet bgs, a middle clay zone from 43 to 55 feet bgs, and a lower zone from 55 to the maximum depth of 65.5 feet bgs explored. Soil samples from various depths were submitted for laboratory analysis. TPHg was reported in five upper zone, six clay zone, and three lower zone soil samples at concentrations up to 700 milligrams per kilogram (mg/kg). MTBE was reported in three upper zone, three clay zone, and two lower zone soil samples at concentrations up to 0.29 milligrams per kilogram (mg/kg). Benzene was reported in three clay zone soil samples at concentrations up to 1.3 mg/kg. TPHg was reported in all of the 14 groundwater samples at concentrations up to 26,000 µg/L. Benzene was reported in five upper zone, and six lower zone groundwater samples at concentrations up to 510 µg/L. MTBE was reported in four upper zone, and six lower zone groundwater samples at concentrations up to 1,100 µg/L.

In March 2007, two additional on-site borings (B-8 and B-9) and one additional off-site boring (B-10) were advanced using a CPT rig. The borings were advanced to further evaluate the vertical extent of impacted groundwater to the base of the lowermost sand and gravel unit, to evaluate groundwater quality in the lowermost sand and gravel unit down-gradient of the site, and to evaluate the presence of a clay layer underlying the lowermost coarse-grained soils which may represent a regional aquitard. Four soil samples were collected for laboratory analysis from off-site boring B-10. MTBE was reported in two of the samples at concentrations up to 0.016 mg/kg; TPHg and benzene were below the laboratory's indicated reporting limits in all of the soil samples collected for analysis. TPHg (200 µg/L), benzene (0.94 µg/L), and MTBE (7.1 µg/L) were reported in the groundwater sample collected at 79 to 83 feet bgs from boring B-8. TPHg, BTEX, and fuel oxygenates were below the laboratory's indicated reporting limits in the groundwater sample collected at 78 to 88 feet bgs from boring B-9. A low concentration of MTBE (0.73 µg/L) was reported in the groundwater sample collected at 66 to 70 feet bgs from boring B-10, and a low concentration of toluene (1.4 µg/L) was reported in the groundwater sample collected at 83 to 87 feet bgs from boring B-10. Based on the results of the investigation, soil and groundwater in the area of off-site boring B-10 did not appear to be significantly impacted, groundwater within the lowermost sand and gravel unit in the area of boring B-8 was slightly impacted, and groundwater within the lowermost sand and gravel unit in the area of boring B-9 was not impacted.

Quarterly monitoring of the site wells has been performed since July 1998. Historically, the groundwater flow direction has varied from the north to the southwest. The depth to groundwater has varied from 21.62 feet bgs to 46.31 feet bgs.

Although the ozone system experienced problems with consistent operation, it appeared to be effective as TPHg, BTEX, and MTBE concentrations in monitoring well U-3 significantly decreased since startup of the system. The system was shut down in October 2006 to evaluate for groundwater concentration rebound. In March 2007, oxygen injection testing was performed in sparge wells SP-5/5S and SP-6S to evaluate the radius of influence (ROI) of the existing sparge wells, and to evaluate the effectiveness of the existing system. As described in our *Additional Subsurface Assessment Report*, dated April 26, 2007, the testing suggested a ROI of between 10 to 15 feet around the wells on average, but perhaps greater in some areas.

Impacted groundwater remains beneath the site in the areas of monitoring wells U-6 and U-7. Impacted groundwater also remains in the northwest portion of the site based on the results of the borings advanced in April 2006.

In September and October 2008, eight on-site monitoring wells (U-8 to U-15) were installed under the supervision of Delta Consultants. Soil samples collected and submitted for analysis from borings U-8 to U-11 reported total purgeable petroleum hydrocarbons (TPPH) ranging from 0.45 to 1,900 mg/kg (U-8 to U-11), benzene at 0.7 mg/kg (U-10@48 feet), and MTBE ranging from 0.29 to 0.54 mg/kg (U-10 and U-11). The details of this investigation were summarized in a *Site Investigation Report* dated, November 11, 2008.

SENSITIVE RECEPTORS

2006 – A survey entailing a visit to the DWR office in Sacramento was conducted to examine well log records and to identify domestic wells within the survey area. The DWR survey provided 53 potential receptors within one mile of the site; eleven municipal wells, five irrigation wells, two domestic wells, one domestic/irrigation well, and seventeen with an unknown well type. Seventeen additional potential receptors were identified although the specific addresses could not be verified.

MONITORING AND SAMPLING

The current well network consists of 13 onsite and 2 offsite wells. Currently, all wells are monitored and sampled on a semi-annual basis during second and fourth quarters. Samples collected from these wells are analyzed for TPHg, benzene, toluene, ethylbenzene, and total xylenes (BTEX), and 8 fuel oxygenates [methyl tert butyl ether (MTBE), tert butyl alcohol (TBA), ethylene dibromide (EDB), 1,2 dichloroethane (1,2-DCA), diisopropyl ether (DIPE), ethyl tert butyl ether (ETBE), tert amyl methyl ether (TAME), and ethanol] by EPA method 8260B.

During the current monitoring and sampling event performed by TRC on December 20, 2010, depth to groundwater ranged from 25.99 feet below top of casing (TOC) in well U-2 to 34.67 feet below TOC in well U-5. The groundwater gradient and flow direction was interpreted to be 0.06 feet per foot (ft/ft) to the west. This is somewhat consistent with a gradient and flow direction of 0.02 ft/ft to the west during the previous sampling event (6/15/10). This is also consistent with historical flow directions which trend predominantly to the west, and to a lesser extent, to the southwest and northwest. A historical groundwater flow direction rose diagram is presented as Attachment A.

Contaminants of Concern:

The following analytical results are from the Third through Fourth Quarter 2010 monitoring event.

TPHg: TPHg was above laboratory indicated reporting limits in the groundwater samples collected from eight of the fifteen wells sampled with a maximum concentration of 2,400 µg/L in well U-8 during the current sampling event. This is a significant decrease from a maximum concentration of 12,000 µg/L in well U-10 during the previous sampling event (6/15/10). Wells U-3, U-5, U-6, U-7, U-9, U-10, and U-11 were reported with concentrations of 1,100 µg/L, 51 µg/L, 2,000 µg/L, 1,600 µg/L, 1,900 µg/L, 2,100 µg/L, and 1,700 µg/L, respectively, during the current sampling event.

Benzene: Benzene was above laboratory indicated reporting limits in the groundwater samples collected six of the fifteen wells sampled with a maximum concentration of 79 µg/L in well U-10 during the current sampling event. This is a significant decrease from a maximum concentration of 550 µg/L in U-10 during the previous sampling event. Wells U-3, U-6, U-7, U-8, and U-9 were reported with concentrations of 5.1 µg/L, 29 µg/L, 2.9 µg/L, 11 µg/L, and 7.0 µg/L, respectively, during the current sampling event.

Toluene: Toluene was above laboratory indicated reporting limits in groundwater samples collected from four of the fifteen wells sampled with a maximum concentration of 2.9 µg/L in well U-10 during the current sampling event. This is a significant decrease from a maximum concentration of 70 µg/L in U-10 during the previous sampling event. Wells U-7, U-9, and U-10 were reported with concentrations of 0.83 µg/L, 2.0 µg/L, and 2.4 µg/L, respectively, during the current sampling event.

Ethylbenzene: Ethylbenzene was above laboratory indicated reporting limits in groundwater samples collected from five of the fifteen wells sampled with a maximum concentration of 98 µg/L in well U-10 during the current sampling event. This is a significant decrease from a maximum concentration of 780 µg/L in well U-10 during the previous sampling event. Wells U-6, U-7, U-8, and U-9 were reported with concentrations of 94 µg/L, 7.9 µg/L, 22 µg/L, and 45 µg/L, respectively, during the current sampling event.

Total Xylenes: Total Xylenes were above laboratory indicated reporting limits in four of the fifteen wells sampled with a maximum concentration of 33 µg/L in well U-10 during the current sampling event. This is a significant decrease from a maximum concentration of 1,400 µg/L in U-10 during the previous sampling event. Wells U-6, U-8, and U-9 were reported with concentrations of 10 µg/L, 12 µg/L, and 9.7 µg/L, respectively, during the current sampling event.

MTBE: MTBE was above laboratory indicated reporting limits in the groundwater samples collected from eight of the fifteen wells sampled with a maximum concentration of 1,400 µg/L in well U-11 during the current sampling event. This is a significant decrease from a maximum concentration of 3,600 µg/L in U-11 during the previous sampling event. Wells U-3, U-4, U-5, U-6, U-7, U-9, and U-10 were reported with concentrations of 49 µg/L, 7.5 µg/L, 52 µg/L, 12 µg/L, 13 µg/L, 4.3 µg/L, and 98 µg/L, respectively, during the current sampling event.

TBA: TBA was above laboratory indicated reporting limits in groundwater samples collected from three of the fifteen wells sampled with a maximum concentration of 3,700 µg/L in well U-3 during the current sampling event. This is a significant decrease from a maximum concentration of 11,000 µg/L in U-3 during the previous sampling event. Wells U-3 and U-10 were reported with concentrations of 2,800 µg/L and 610 µg/L, respectively, during the current sampling event.

Other Fuel Oxygenates: EBD, 1,2-DCA, DIPE, ETBE, TAME, and ethanol were all below laboratory indicated reporting limits for all of the fifteen wells sampled during the current sampling event. This is consistent with the previous two sampling events.

In addition, at the request of the Alameda County Health Care Services Agency (ACHCSA) each groundwater sample collected and submitted for analysis were analyzed for CAM 17 metals, total dissolved solids, hexavalent chromium, major anions and major cations. The additional analytical data is presented in tables 1a through 1e in TRC's *Groundwater Monitoring Report - October through December 2010*, dated January 17, 2011 (Attachment B).

REMEDIATION STATUS

The ozone sparge system, manufactured by KVA, was placed into operation on December 19, 2001. Remediation system operation and maintenance is conducted by Environ Strategy Consultants, Inc. (ES) under direct contract to COP.

During the Second Quarter 2007, the ozone system was shut down, to evaluate whether dissolved gasoline concentrations would rebound or remain stable in the absence of ozone injection with the current well and system configuration.

As approved in an Alameda County Environmental Health Agency letter dated May 4, 2010, a Magnesium Sulfate pilot test was started May 28, 2010, and concluded on July 26, 2010. The test consisted of the application of 110 gallons of 29% magnesium sulfate (13% sulfate) into well U-11. Grab groundwater samples were collected from the application well (U-11), U-8, U-10, SP-2, SP-5, and SP-8 prior to and immediately following application, as well as 1, 3, 6, and 8 weeks following application. The table below presents analytical data collected.

The application of magnesium sulfate caused an initial increase in TPHg and BTEX concentrations in the application well U-11. It is not unusual to see an increase shortly after a magnesium sulfate solution application. Explanations include that the sulfate stimulates biological activity and that activity opens up some of the pore spaces resulting in more contaminant mass exposed to groundwater and/or generates a surfactant effect that allows greater mass transfer and consequently higher concentrations.

Currently, TPHg concentrations have shown an increase compared to concentrations prior to the application. However, sulfate levels have generally dropped compared to prior to the application, which indicated that the sulfate is being

consumed in the subsurface. The application well showed increased concentrations initially, followed by declining concentrations. As this well (U-11) received the highest concentrations of sulfate during the application, this indicated that the sulfate is working in enhancing biodegradation of the contaminants. The surrounding wells, having not received sulfate concentrations as high, have not yet past the initial increase toward declining concentrations. Sparge Points SP-5 and SP-8, having the lowest initial contamination, did not show an initial spike in concentrations. Wells with lower pre-application concentrations did not show the same initial spike as did the wells with higher pre-application concentrations. Antea believes that as the sulfate continues to work in the subsurface, and with continued semi-annual monitoring and sampling (M&S), decreases in the application well and surrounding wells will become more apparent.

The magnesium sulfate introduced into the subsurface during the 2010 pilot test continues to degrade hydrocarbon impact. Between the second quarter 2010 sampling event and the fourth quarter 2010 sampling event, maximum constituent concentrations dropped significantly. TPHg dropped from 12,000 µg/L to 2,400 µg/L, benzene dropped from 550 µg/L to 79 µg/L, MTBE dropped from 3,600 µg/L to 1,400 µg/L, and TBA dropped from 11,000 µg/L to 3,700 µg/L.

As TBA is a regulatory concern, below is a table that details TBA concentrations from prior to, during, and after the magnesium sulfate pilot test:

TBA Concentrations

Well	Date	Type	Description	TBA
U-3	12/9/2009	Purge	4Q09 M&S, Prior to Pilot Test	8800
	6/15/2010	Purge	2Q10 M&S, During Pilot Test	11000
	12/20/2010	Purge	4Q10 M&S, After Pilot Test	2800
U-8	12/9/2009	Purge	4Q09 M&S, Prior to Pilot Test	<50
	5/28/2010	Grab	Pilot Test, Prior to Application	<10
	6/15/2010	Purge	2Q10 M&S, During Pilot Test	<20
	7/13/2010	Grab	Pilot Test, After Application	<10
	7/26/2010	Grab	Pilot Test, After Application	<10
	12/20/2010	Purge	4Q10 M&S, After Pilot Test	<20
U-10	12/9/2009	Purge	4Q09 M&S, Prior to Pilot Test	1100
	5/28/2010	Grab	Pilot Test, Prior to Application	98
	6/15/2010	Purge	2Q10 M&S, During Pilot Test	2400
	7/13/2010	Grab	Pilot Test, After Application	380
	7/26/2010	Grab	Pilot Test, After Application	310
	12/20/2010	Purge	4Q10 M&S, After Pilot Test	610
U-11*	12/9/2009	Purge	4Q09 M&S, Prior to Pilot Test	10000
	5/28/2010	Grab	Pilot Test, Prior to Application	7900
	6/15/2010	Purge	2Q10 M&S, During Pilot Test	6600
	7/13/2010	Grab	Pilot Test, After Application	6900
	7/26/2010	Grab	Pilot Test, After Application	9100
	12/20/2010	Purge	4Q10 M&S, After Pilot Test	3700

* Pilot Test Application Well

CHARACTERIZATION STATUS

The furthest up-gradient monitor well, U-7, contained 13 µg/L MTBE and 1,600 µg/L TPHg during the fourth quarter 2010 sampling event. The furthest off-site down-gradient monitoring well, U-4, contained 7.5 µg/L MTBE and was non-detect for TPHg during the fourth quarter 2010 monitoring and sampling event. Monitoring wells U-1 and U-2 were non-detect for MTBE and TPHg. Monitoring well U-6 contained 12 µg/L MTBE and 2,000 µg/L TPHg during the fourth quarter 2010 sampling event.

WASTE DISPOSAL SUMMARY

June 1996 - A total of 25 cubic yards of soils was excavated and disposed.

April 2006 - A total of 2.2 cubic yards of soil cuttings generated during a soil investigation was disposed of from the site.

RECENT CORRESPONDENCE

May 4, 2010: A letter from ACHCS was received approving proposed magnesium sulfate pilot test activities.

October 25, 2010: A letter from ACHS was received in response to Delta's Magnesium Sulfate Pilot Test Report, dated September 15, 2010.

THIRD THROUGH FOURTH QUARTERS 2010 ACTIVITIES

1. TRC performed semi-annual monitoring and sampling on December 20, 2010, and prepared their results in the *Groundwater Monitoring Report – October through December 2010*, dated January 17, 2010.

FIRST THROUGH SECOND QUARTERS 2011 PLANNED ACTIVITIES

1. Antea will continue to monitor the effects of the magnesium sulfate pilot test.
2. TRC will perform semi-annual groundwater monitoring and sampling and prepare their results in a semi-annual groundwater monitoring report.
3. Antea will submit a semi-annual summary report.

LIMITATIONS AND CERTIFICATIONS

This report was prepared in accordance with the scope of work outlined in Antea's contract and with generally accepted professional engineering and environmental consulting practices existing at the time this report was prepared and applicable to the location of the site. It was prepared for the exclusive use of ConocoPhillips for the expressed purpose stated above. Any re-use of this report for a different purpose or by others not identified above shall be at the user's sole risk without liability to Antea. To the extent that this report is based on information provided to Antea by third parties, Antea may have made efforts to verify this third party information, but Antea cannot guarantee the completeness or accuracy of this information. The opinions expressed and data collected are based on the conditions of the site existing at the time of the field investigation. No other warranties, expressed or implied, are made by Antea.

Maximum reported benzene concentration: **330 µg/l (MW-5)**

Sample Points with **TPH-G by GC/MS** **2** Maximum: **7,400 µg/l (MW-5)**

Sample Points with **MTBE 8260B** **3** Maximum: **120 µg/l (MW-5)**

Notes:

USTW=Gauge only

TABLES

TABLE KEY

STANDARD ABBREVIATIONS

--	= not analyzed, measured, or collected
LPH	= liquid-phase hydrocarbons
$\mu\text{g/l}$	= micrograms per liter (approx. equivalent to parts per billion, ppb)
mg/l	= milligrams per liter (approx. equivalent to parts per million, ppm)
ND<	= not detected at or above laboratory detection limit
TOC	= top of casing (surveyed reference elevation)
D	= duplicate
P	= no-purge sample

ANALYTES

DIPE	= di-isopropyl ether
ETBE	= ethyl tertiary butyl ether
MTBE	= methyl tertiary butyl ether
PCB	= polychlorinated biphenyls
PCE	= tetrachloroethene
TBA	= tertiary butyl alcohol
TCA	= trichloroethane
TCE	= trichloroethylene
TPH-G	= total petroleum hydrocarbons with gasoline distinction
TPH-G (GC/MS)	= total petroleum hydrocarbons with gasoline distinction utilizing EPA Method 8260B
TPH-D	= total petroleum hydrocarbons with diesel distinction
TRPH	= total recoverable petroleum hydrocarbons
TAME	= tertiary amyl methyl ether
1,2-DCA	= 1,2-dichloroethane (same as EDC, ethylene dichloride)

NOTES

1. Elevations are in feet above mean sea level. Depths are in feet below surveyed top-of-casing.
2. Groundwater elevations for wells with LPH are calculated as: Surface Elevation – Measured Depth to Water + (Dp x LPH Thickness), where Dp is the density of the LPH, if known. A value of 0.75 is used for gasoline and when the density is not known. A value of 0.83 is used for diesel.
3. Wells with LPH are generally not sampled for laboratory analysis (see General Field Procedures).
4. Comments shown on tables are general. Additional explanations may be included in field notes and laboratory reports, both of which are included as part of this report.
5. A “J” flag indicates that a reported analytical result is an estimated concentration value between the method detection limit (MDL) and the practical quantification limit (PQL) specified by the laboratory.
6. Other laboratory flags (qualifiers) may have been reported. See the official laboratory report (attached) for a complete list of laboratory flags.
7. Concentration graphs based on tables (presented following Figures) show non-detect results prior to the Second Quarter 2000 plotted at fixed values for graphical display. Non-detect results reported since that time are plotted at reporting limits stated in the official laboratory report.
8. Prior to the 1st quarter 2010, the word “monitor” was used in table comments interchangeably with the word “gauge”. Starting in the 1st quarter 2010, the word “monitor” is used to include both “gauge” and “sample”.

REFERENCE

TRC began groundwater monitoring and sampling for 76 Station 4625 in October 2004. Historical data compiled prior to that time were provided by Gettler-Ryan Inc.

GENERAL FIELD PROCEDURES

Groundwater Monitoring and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater monitoring and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Wells that are found to contain LPH are not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed. Bailed fluids are placed in a container separate from normal purge water, and properly disposed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurements are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously until they become stable in general accordance with EPA guidelines.

Purge water is generally collected in labeled drums for disposal. Drums may be left on site for disposal by others, or transported to a collection location for eventual transfer to a licensed treatment or recycling facility. In some cases, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

Samples are collected by lowering a new, disposable, ½-inch to 4-inch polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

After filling, all containers are labeled with project number (or site number), well designation, sample date, sample time, and the sampler's initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging and Sampling

The sequence in which monitoring activities are conducted is specified on the TSR. In general, wells are gauged beginning with the least affected well and ending with the well that has the highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected to the most-affected well.

Decontamination

In order to reduce the possibility of cross contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging, and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liqui-nox and water and rinsing twice. The final rinse is in deionized water.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, and noted on the site TSR, are documented in field notes on the following pages.

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A23	Associated surrogate recovery is high.
L01	The Laboratory Control Sample Water (LCSW) recovery is not within laboratory established control limits.
Q03	Matrix spike recovery(s) is(are) not within the control limits.

STATEMENTS

Purge Water Disposal

Non-hazardous groundwater produced during purging and sampling of monitoring wells is accumulated at TRC's groundwater monitoring field office at Concord, California, for transportation by a licensed carrier to an authorized disposal facility. Currently, non-hazardous purge water is transported under a bulk non-hazardous waste manifest to Crosby and Overton, Inc. in Long Beach, California.

Limitations

The fluid level monitoring and groundwater sampling activities summarized in this report have been performed under the responsible charge of a California Registered Geologist or Registered Civil Engineer and have been conducted in accordance with current practice and the standard of care exercised by geologists and engineers performing similar tasks in this area. No warranty, express or implied, is made regarding the conclusions and professional opinions presented in this report. The conclusions are based solely upon an analysis of the observed conditions. If actual conditions differ from those described in this report, our office should be notified.
