RECEIVED

10:54 am, Feb 10, 2012

Alameda County
Environmental Health

I have reviewed the attached report dated February 2, 2012.

I agree with the conclusions and recommendations presented in the referenced report. The information in this report is accurate to the best of my knowledge and all local Agency/Regional Board guidelines have been followed. This report was prepared by Conestoga-Rovers & Associates, upon whose assistance and advice I have relied.

This letter is submitted pursuant to the requirements of California Water Code Section 13267(b)(1) and the regulating implementation entitled Appendix A pertaining thereto.

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge.

Sincerely,

Roya Kambin
Union Oil of California – Project Manager

Re: Second Semi-Annual 2011
Groundwater Monitoring and Sampling Report
UNOCAL # 4186 (Union Oil Site 351721)
1771 First Street
Livermore, California
Fuel Leak Case No. RO00000436

Dear Mr. Jerry Wickham:

On behalf of Chevron Environmental Management Company, for itself and as Attorney-in-Fact for Union Oil Company of California (hereinafter "EMC"), Conestoga-Rovers & Associates is submitting this *Second Semi-Annual 2011 Groundwater Monitoring and Sampling Report* for the site referenced above (Figures 1 through 4).

Groundwater monitoring and sampling was performed by TRC Solutions, Inc. (TRC) of Irvine, California. TRC's December 21, 2011 *Transmittal of Groundwater Monitoring Data* is presented as Attachment A. Current groundwater monitoring and sampling data are presented in Table 1. Laboratory analyses were performed by BC Laboratories of Bakersfield, California. BC Laboratories' December 22 and 23, 2011 laboratory reports are included as Attachment B. Historical groundwater monitoring and sampling data is included as Attachment C.

RESULTS OF SECOND SEMI-ANNUAL 2011 EVENT

On December 7 and 8, 2011, TRC monitored and sampled the site wells per the established schedule.

Results of the current monitoring event indicate the following:

- Groundwater Flow Direction Northwest; shallow and intermediate zones
West-northwest; deep zone
 - Hydraulic Gradients Shallow zone: 0.03
Intermediate zone: 0.02
Deep zone: 0.01
 - Approximate Depth to Groundwater Shallow zone: 32 to 33 feet below grade (fbg)
Intermediate zone: 34 to 36 fbg
Deep zone: 35 to 36 fbg

A partial summary of results from the current sampling event are presented below in Table A:

TABLE A: GROUNDWATER ANALYTICAL DATA

TABLE A: GROUNDWATER ANALYTICAL DATA										
Well ID	Water Bearing Zone	TPHg (µg/L)	B (µg/L)	T (µg/L)	E (µg/L)	X (µg/L)	MTBE (µg/L)	Cr Total (µg/L)	Cr VI (µg/L)	Ni (µg/L)

Metals Analysis

Groundwater samples from 7 of the 15 wells were analyzed for total California Administrative Manual (CAM)-17 metals, dissolved CAM-17 metals, and dissolved hexavalent chromium (Chromium VI) to assess any byproducts of ozone and magnesium sulfate remedial injections. Eleven of the dissolved metal concentrations within the seven wells exceeded drinking water environmental screening levels (ESLs).¹ These concentrations are generally within historical ranges. Metals concentrations are summarized in Table A above and in Table 1 attached.

CONCLUSIONS AND RECOMMENDATIONS

The results of ongoing groundwater monitoring and sampling at the site indicate the following:

- Constituents of concern (COCs) are TPHg, benzene, MTBE, and TBA
- Dissolved hydrocarbon concentrations are primarily detected in the intermediate water-bearing zone. Concentrations in the intermediate zone are stable and defined by downgradient by wells U-4 and U-5

¹ Table A of San Francisco Regional Water Quality Control Board's *Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater*, Interim Final November 2007 (Revised May 2008).

**CONESTOGA-ROVERS
& ASSOCIATES**

February 2, 2012

Reference No. 060719

- 4 -

- Due to insufficient water none of the wells monitoring the shallow water-bearing zone were sampled.
- No dissolved hydrocarbons are detected in the deep water-bearing zone indicating vertical delineation in groundwater
- Dissolved tertiary butyl ether (TBA) was detected in intermediate well U-11 at a concentration of 11,000 µg/L and the downgradient extent is defined by the existing well network
- Eleven dissolved metal concentrations within seven wells exceeded ESLs. However, these concentrations are generally within historical ranges

CRA recommends:

- Continuing semi-annual monitoring and sampling to verify decreasing concentration trends over time
- Continuing monitoring of total and dissolved Chromium VI and nickel, but discontinuing all other metal analysis
- Conducting a degradation analysis using historical concentration trend data to determine timeframes for COCs to reach ESLs

ANTICIPATED FUTURE ACTIVITIES

Groundwater Monitoring

TRC will monitor and sample site wells per the established schedule. CRA will submit a groundwater monitoring and sampling report.

Additional Activity

CRA will present analytical results of a Compound Specific Isotope Analysis performed on samples collected during this groundwater sampling event in an upcoming report. This analysis was performed under the direction of ACEH to help determine the degree of biodegradation of constituents in groundwater. CRA will also present a degradation rate analysis to assess when COCs will reach water quality objectives.

Please contact Laura Heberle at 916-889-8918 if you have any questions or require additional information.

RE: Transmittal of Groundwater Monitoring Data

Dear Mr. McDonald,

Please find attached the field data sheets, chain of custody (COC) forms, and technical services request (TSR) form for the monitoring event that was completed on December 7, 2011. Field measurements and collection of samples submitted to the laboratory were completed in general accordance with our usual groundwater monitoring protocol which is also attached for your reference.

Please call me at 949-341-7440 if you have questions.

Sincerely,

Anju Farfan
Groundwater Program Operations Manager

GENERAL FIELD PROCEDURES

Groundwater Gauging and Sampling Assignments

For each site, TRC technicians are provided with a Technical Service Request (TSR) that specifies activities required to complete the groundwater gauging and sampling assignment for the site. TSRs are based on client directives, instructions from the primary environmental consultant for the site, regulatory requirements, and TRC's previous experience with the site.

Fluid Level Measurements (Gauging)

Initial site activities include determination of well locations based on a site map provided with the TSR. Well boxes are opened and caps are removed. Indications of well or well box damage or of pressure buildup in the well are noted.

Fluid levels in each well are measured using a coated cloth tape equipped with an electronic interface probe, which distinguishes between liquid phase hydrocarbon (LPH) and water. The depth to LPH (if it is present), to water, and to the bottom of the well are measured from the top of the well casing (surveyors mark or notch if present) to the nearest 0.01 foot. Unless otherwise instructed, a well with less than 0.67 foot between the measured top of water and the measured bottom of the well casing is considered dry, and is not sampled. If the well contains 0.67 foot or more of water, an attempt is made to bail and/or sample as specified on the TSR.

Unless otherwise instructed, a well that is found to contain a measureable amount of LPH (0.01 foot) is not purged or sampled. Instead, one casing volume of fluid is bailed from the well and the well is re-sealed.

Purging and Groundwater Parameter Measurement

TSR instructions may specify that a well not be purged (no-purge sampling), be purged using low-flow methods, or be purged using conventional pump and/or bail methods. Conventional purging generally consists of pumping or bailing until a minimum of three casing volumes of water have been removed or until the well has been pumped dry. Pumping is generally accomplished using submersible electric or pneumatic diaphragm pumps. The pump intake is initially set at about 5 feet below the level of water in the casing, and is lowered as needed to compensate for falling water level. Pump depths are recorded in Field Notes.

During conventional purging, three groundwater parameters (temperature, pH, and conductivity) are measured after removal of each casing volume. Stabilization of these parameters, to within 10 percent, confirm that sufficient purging has been completed. In some cases, the TSR indicates that other parameters are also to be measured during purging. TRC commonly measures dissolved oxygen (DO), oxidation-reduction potential (ORP), and/or turbidity. Instruments used for groundwater parameter measurements are calibrated daily according to manufacturer's instructions.

Low-flow purging utilizes a bladder or peristaltic pump to remove water from the well at a low rate. Groundwater parameters specified by the TSR are measured continuously, using a flow cell, until they become stable in general accordance with EPA guidelines.

Groundwater Sample Collection

After wells are purged, or not purged, according to TSR instructions, samples are collected for laboratory analysis. For wells that have been purged using conventional pump or bail methods, sampling is conducted after the well has recovered to 80 percent of its original volume or after two hours if the well does not recover to at least 80 percent. If there is insufficient recharge of water in the well after two hours, the well is not sampled.

GENERAL FIELD PROCEDURES

Samples are collected by lowering a new, disposable polyethylene bottom-fill bailer to just below the water level in the well. The bailer is retrieved and the water sample is carefully transferred to containers specified for the laboratory analytical methods indicated by the TSR. Particular care is given to containers for volatile organic analysis (VOAs) which require filling to zero headspace and fitting with Teflon-sealed caps.

Sample containers are labeled with project number (or site number), well designation, sample date, sample time, and the sampler's initials, and placed in an insulated chest with ice. Samples remain chilled prior to and during transport to a state-certified laboratory for analysis. Sample container descriptions and requested analyses are entered onto a chain-of-custody form in order to provide instructions to the laboratory. The chain-of-custody form accompanies the samples during transportation to provide a continuous record of possession from the field to the laboratory. If a freight or overnight carrier transports the samples, the carrier is noted on the form.

For wells that have been purged using low-flow methods, sample containers are filled from the effluent stream of the bladder or peristaltic pump. In some cases, if so specified by the TSR, samples are taken from the sample ports of actively pumping remediation wells.

Sequence of Gauging, Purging and Sampling

The sequence in which monitoring activities are conducted is specified on the TSR. In general, wells are gauged beginning with the least affected well and ending with the well that has the highest concentration based on previous analytic results. After all gauging for the site is completed, wells are purged and/or sampled from the least-affected to the most-affected well. If wells must be gauged or sampled out of order, alternate interface probes and/or pumps are utilized and are noted in field documentation.

Decontamination

In order to reduce the possibility of cross contamination between wells, strict isolation and decontamination procedures are observed. Portable pumps are not used in wells with LPH. Technicians wear nitrile gloves during all gauging, purging, and sampling activities. Gloves are changed between wells and more often if warranted. Any equipment that could come in contact with fluids are either dedicated a particular well, decontaminated prior to each use, or discarded after a single use. Decontamination consists of washing in a solution of Liquinox and water and rinsing twice. The final rinse is in deionized water.

Purge Water Disposal

Purge water is generally collected in labeled drums for disposal as non-hazardous waste. Drums may be left on site for disposal by others, or transported to a collection location at a TRC field office, in either Fullerton, California or Concord, California, for eventual transfer to a licensed treatment or recycling facility. Alternatively, purge water may be collected directly from the site by a licensed vacuum truck company, or may be treated on site by an active remediation system, if so directed.

Exceptions

Additional tasks or non-standard procedures, if any, that may be requested or required for a particular site, are documented in field notes on the following pages.

LAB INFORMATION:

Global ID: T0600101777

Lab WO: 351721

Lab Used: BC Labs

Lab Notes: Lab Analyses for all wells:
TPH-G by GC/MS, BTEX/MTBE/OXYS by 8260B, EDB/EDC by 8260B, Ethanol by 8260B [Containers: 3 voas w/HCl]
Sulfate, Nitrate [Container: one 1L plastic unpreserved]
Dissolved Ferrous Iron by 350FE+B [Container: one 500 mL poly unpreserved]
Methane by EPA 8015B [containers: 2 unpreserved voas]

✓ ✓ ✓ ✓ ✓ ✓
Additional Analyses for wells U-1, U-2, U-4, U-8, U-9, U-10, U-11, U-13 and U-15:
Hexavalent Chromium by 6010, TDS by 160.1, Dissolved CAM 17 Metals, Chloride, Fluoride, Dissolved Metals (Ca, Na, Mg, K, Mn) [Container: one 1L plastic unpreserved]
Total CAM 17 Metals [Container: one 1Pt poly w/HNO3]

ATTACHMENT B
LABORATORY ANALYTICAL REPORT

Laboratories, Inc.

Environmental Testing Laboratory Since 1949

Date of Report: 12/22/2011

Jim Schneider

Conestoga-Rovers & Associates

5900 Hollis St. Suite A
Emeryville, CA 94608

Project: 4186

BC Work Order: 1120089

Invoice ID: B113622

Enclosed are the results of analyses for samples received by the laboratory on 12/7/2011. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Contact Person: Molly Meyers
Client Service Rep

Authorized Signature

Certifications: CA ELAP #1186; NV #CA00014

Notes And Definitions

MDL	Method Detection Limit
ND	Analyte Not Detected at or above the reporting limit
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
A01	PQL's and MDL's are raised due to sample dilution.
A02	The difference between duplicate readings is less than the PQL.
A03	The sample concentration is more than 4 times the spike level.
Q03	Matrix spike recovery(s) is(are) not within the control limits.
S01	Sample result is not within the quantitation range of the method.
