Re: Chevron Service Station #9-1924  
4904 Southfront Road  
Livermore, CA

Dear Mr. Shahid:

Enclosed we are forwarding the Quarterly Groundwater Sampling report dated June 12, 1990, conducted by our consultant Western Geologic Resources, Inc., at the above referenced site.

The groundwater extraction system and treatment system is in operation. We will keep you apprised of our recovery progress.

Chevron will continue to sample this site on a quarterly basis.

I declare under penalty of perjury that the information contained in the attached report is true and correct, and that any recommended actions are appropriate under the circumstances, to the best of my knowledge.

If you have any questions or comments please do not hesitate to call me at (415) 842-9581.

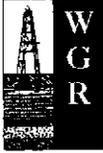

Very truly yours,

C. G. Trimbach

Re: Quarterly Groundwater Monitoring  
Sampled May 1990  
Chevron Service Station #91924  
4904 Southfront Road  
Livermore, California  
WGR Project #1-024.01

Dear Mr. Randall:

This letter report presents the results of the quarterly groundwater monitoring performed on 7 and 8 May 1990 by Western Geologic Resources, Inc. (WGR) at the subject site (Figure 1).

#### **GROUNDWATER SAMPLING**

On 7 and 8 May 1990, WGR staff measured depth-to-water and purged monitor wells C-1 through C-3 and C-5 through C-19 with dedicated sampling systems. Wells C-11 and C-14 were purged dry before three well-casing volumes could be evacuated and the wells were allowed to recover overnight. Monitor wells C-11 and C-14 were sampled after recovering to 18% and 60% of their original static water levels, respectively. The other wells were sampled after three well-casing volumes were evacuated. All groundwater samples were collected according to the WGR standard operating procedure for groundwater sampling included as Attachment A; field sampling and monitoring forms are included as Attachment B.

All purged water was temporarily stored on-site in 55-gallon drums pending analytic results. The groundwater samples and a laboratory-supplied travel blank, consisting of deionized water, were shipped under chain-of-custody to Pace Laboratories, Inc. (PACE) of Novato, California.

#### **GROUNDWATER FLOW**

Figure 2 shows the potentiometric surface of shallow groundwater, based on depth-to-water measurements taken on 7 and 8 May 1990. Groundwater-elevation data are presented in Table 1. Hydrographs showing groundwater elevations over time are included as Attachment C. Average

groundwater flow direction for 7 and 8 May 1990 was to the west at an average gradient of about 3.0%.

### **ANALYTIC RESULTS**

Groundwater samples from monitor wells C-1 through C-3 and C-5 through C-19 were analyzed for total purgeable petroleum hydrocarbons (TPPH) and for benzene, toluene, ethylbenzene and total xylenes (BTEX) by EPA Methods 8015 and 8020, respectively. Selected halocarbons were analyzed for using EPA Method 8010. Analytic results for past sampling events and this round of sampling are presented in Table 2. The chain-of-custody forms and laboratory reports with quality assurance/quality control (QA/QC) documents are included as Attachment D and E, respectively. Distribution maps of TPH and benzene in shallow groundwater are presented as Figures 3 and 4, respectively.

### **COMMENTS**

The analytic results for May 1990 indicated concentrations of TPPH and BTEX similar to those reported in the January 1990 analysis with exception to the analytic results for the groundwater samples from wells C-9 and C-11. The sample from monitor well C-9 showed a significant increase in concentrations of TPPH and BTEX compared to the January 1990 sampling, but the results were similar to concentrations detected prior to October 1989. The sample from monitor well C-11 also had higher concentrations of BTEX than previously reported and 110 parts-per-billion TPPH. Both C-9 and C-11 are in the down-gradient direction from the areas of highest contaminant levels, with respect to estimated groundwater flow direction. Groundwater flow direction and gradient were also similar to that previously reported.

J. Randall/12 June 1990

3

Western Geologic Resources, Inc. is pleased to provide geologic and environmental consulting services for Chevron and trust that this report meets your needs. Please call us at (415) 475-7595 if you have any questions.

Sincerely,  
Western Geologic Resources, Inc.

Joel Coffman  
Staff Geologist

Thomas J. Echols  
Senior Geologist

### **SOP-4: GROUNDWATER PURGING AND SAMPLING**

**STANDARD OPERATING PROCEDURES  
RE: GROUNDWATER PURGING AND SAMPLING  
SOP-4**

Prior to water sampling, each well is purged by evacuating a minimum of three well-casing volumes of groundwater or until the discharge water temperature, conductivity, and pH stabilize. The groundwater sample should be taken when the water level in the well recovers to 80% of its static level.

The sampling equipment used consists of either a teflon bailer or a stainless steel bladder pump with a teflon bladder. If the sampling system is dedicated to the well, then the bailer is made of teflon, but the bladder pump is PVC with a polypropylene bladder. Forty milliliter (ml) glass volatile-organic-analysis (VOA) vials, with teflon septa, are used as sample containers.

The groundwater sample is decanted into each VOA vial in such a manner that there is a meniscus at the top of the vial. The cap is quickly placed over the top of the vial and securely tightened. The VOA vial is then inverted and tapped to see if air bubbles are present. If none are present, the sample is labeled and refrigerated for delivery under chain-of-custody to the laboratory. Label information should include a sample identification number, job identification number, date, time, type of analysis requested, and the sampler's name.

For quality control purposes, a duplicate water sample is collected from each well. This sample is put on hold at the laboratory. A trip blank is prepared at the laboratory and placed in the transport cooler. It remains with the cooler and is analyzed by the laboratory along with the groundwater samples. A field blank is prepared in the field when sampling equipment is not dedicated. The field blank is prepared after a pump or bailer has been steam-cleaned, prior to use in a second well, and is analyzed along with the other samples. The field blank demonstrates the quality of in-field cleaning procedures to prevent cross-contamination.

To minimize the potential for cross-contamination between wells, all the well-development and water-sampling equipment that is not dedicated to a well is steam-cleaned between each well. As a second precautionary measure, wells will be sampled in order of least to highest concentrations as established by previous analyses.
