Comments:

Dear Mr. Gholami,

Enclosed is the Second Quarter 1999, Groundwater Monitoring and Sampling Report for the Sears, Roebuck and Co. Store No. 1058 located at 2633 Telegraph Avenue, in Oakland, California. If you have any questions, please call me at (925) 370-3990 extension 266.

Sincerely,
IT Corporation

Melissa Gossell

Subject: Second Quarter 1999, Groundwater Monitoring and Sampling Report
Former Sears 1058, 2600 Telegraph Avenue, Oakland, California
IT Corporation Project 1176603

Dear Mr. Gholami:

On behalf of Sears, Roebuck and Co., IT Corporation presents the quarterly groundwater monitoring data collected on May 11, 1999, from the above referenced site. The 10 groundwater monitoring wells were gauged to determine depth to groundwater and to check for the presence of separate-phase petroleum hydrocarbons. No separate-phase hydrocarbons were detected in the monitoring wells. Separate-phase hydrocarbons had been present in monitoring well MW-3 during the first quarter 1999. A potentiometric surface map is provided in attachment 1, figure 1. A historical summary of groundwater monitoring data is provided in attachment 2, table 1.

After measuring depth to water, seven of the 10 monitoring wells (MW-1, MW-2, MW-3, MW-4, MW-8, MW-9, and EW-1) were purged and sampled. Groundwater monitoring and sample collection protocol, and field data sheets are provided in attachment 3. The groundwater samples were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) and methyl tert-butyl ether (MTBE) using Environmental Protection Agency (EPA) Method 8020; total petroleum hydrocarbons as gasoline (TPH-g) using Environmental Protection Agency (EPA) Method 8015 modified; and total extractable petroleum hydrocarbons as motor oil (TPH-mo) using EPA Method 8015 modified (GC/FID). Confirmation analysis for MTBE was performed on two samples, MW-3 and MW-4, using EPA Method 8260.

Static groundwater levels for the second quarter 1999 ranged from 13.48 to 16.60 feet above mean sea level (an average of 11.52 feet below top of casing). Groundwater elevations have decreased by approximately 1 foot since first quarter 1999 (February 9 and 10, 1999). The apparent groundwater flow is to the south at an average hydraulic gradient of 0.018 foot per foot, and is consistent with previous quarterly data.

Analytical results indicated low benzene concentrations in only one well, MW-3. Low concentrations of MTBE were reported in monitoring wells MW-3 and MW-4 when analyzed by EPA Method 8020; however, using EPA Method 8260, MTBE was below detection limits in these samples. Monitoring wells MW-1, MW-3, MW-9, and EW-1 contained low concentrations of TPH-g. Monitoring wells MW-3 and EW-1 contained TPH-mo at concentrations of 59,000 micrograms per liter ($\mu\text{g/L}$) and 4,800 $\mu\text{g/L}$, respectively. Separate-phase hydrocarbons had been measured in monitoring well MW-3 during the first quarter 1999. Current and previous analyses for dissolved hydrocarbons in MW-3 indicate that the product in this well is predominantly motor oil. A summary of the groundwater analytical results is provided in attachment 2, table 2. A distribution map of dissolved benzene, TPH-g, TPH-mo, and MTBE concentrations is provided in attachment 1, figure 2. Hydrograph and detectable concentration versus time data are illustrated in graphs 1 through 10 (attachment 4). Hydrocarbon concentrations below detection limits are not shown on the graphs. Laboratory reports and chain-of-custody documents are provided in attachment 5.

Historical monitoring data indicate that the thickness of separate-phase hydrocarbons in MW-3 has averaged less than 0.05 foot, and the lateral extent of the product was limited to the vicinity of MW-3; therefore, the volume of separate-phase hydrocarbons at the site is estimated to have been small, less than 5 gallons.

In order to address the separate-phase hydrocarbons issue, an IT field technician visited the site to conduct product bailing and to monitor well recovery after bailing. The purpose of the bailing program was to determine the amount of separate-phase hydrocarbons in groundwater (specifically in MW-3) and the recovery rate after product bailing/removal. The findings of this interim remedial action will be provided under separate cover.

If you have any comments or questions, please contact me at (925) 370-3990 extension 266.

Sincerely,
IT CORPORATION

Notes:

- = No data for the cell, including "not analyzed for this constituent"
- < = Compound was not detected above the laboratory reporting limits.
- mg/l = Milligrams per liter
- TPH = Total petroleum hydrocarbons
- ND = Non-detectable (Detection limits for each metal are listed in laboratory reports.)
- SPH = Separate phase hydrocarbon
- NS = Not sampled
- * = Water samples were not filtered; analytical results represent total metals present, not dissolved concentrations
- ** = Uncategorized hydrocarbon compound not included in this hydrocarbon concentration.
- a = Dissolved lead
- b = Dissolved lead only analyte detected
- c = Dissolved lead, cadmium, total chromium, nickel, and zinc
- d = Cadmium only analyte detected
- e = Hydrocarbon pattern not characteristic of motor oil
- f = Uncategorized compounds included in concentration
- g = Zinc only analyte detected
- h = Chromium only analyte detected
- MTBE = Methyl Tert-Butyl Ether

Attachment 3

**Groundwater Monitoring and Sample Collection
Protocol and Field Data Sheets**

IT CORPORATION GROUNDWATER MONITORING AND SAMPLE COLLECTION PROTOCOL

Groundwater Monitoring

Groundwater monitoring is accomplished using an INTERFACE PROBE™ Well Monitoring System. The INTERFACE PROBE™ Well Monitoring System is a hand held, battery-operated device for measuring the depth to separate-phase hydrocarbons and depth to water. The INTERFACE PROBE™ Well Monitoring System consists of a dual-sensing probe that utilized an optical liquid sensor and electrical conductivity to distinguish between water and petroleum products.

Monitoring is accomplished by measuring from the surveyed top of well casing or grade to groundwater and separate-phase hydrocarbons if present. The static water elevation is then calculated for each well and a potentiometric surface map is constructed. If separate-phase hydrocarbons are detected, the water elevation is adjusted by the following calculation:

$$(\text{Product thickness}) \times (0.8) + (\text{Water elevation}) = \text{Corrected water elevation}$$

Groundwater monitoring wells are monitored in order of wells with lowest concentrations of volatile organic compounds to wells with the highest concentrations, based upon historical concentrations. If separate-phase hydrocarbons are encountered in a well, the product is visually inspected to confirm and note color, amount, and viscosity. Monitoring equipment is washed with laboratory grade detergent and rinsed with distilled or deionized water before monitoring each well.

Groundwater Sampling

Before groundwater samples are collected, sufficient water is purged from each well to ensure representative formation water is entering the well. Wells are purged and sampled in the same order as monitoring, from wells with the lowest concentrations of volatile organic compounds to wells with the highest concentrations. Wells are purged using either a polyvinyl chloride (PVC) bailer fitted with a check valve or with a stainless steel submersible Grundfos pump. The purge equipment is decontaminated before use in each well by washing with laboratory grade detergent and tripled rinsing with deionized or distilled water. A minimum of 3 well-casing volumes of water are removed from each well while pH, electrical conductivity, and temperature are recorded to verify that "fresh" formation water is being sampled and the parameters have stabilized. If the well is low yielding, it may be purged dry and sampled before 3 casing volumes are purged. The wells are then allowed to recharge to approximately 80 percent of the initial water level before a sample is collected.

Groundwater samples are collected from each well using a new, prepackaged disposable bailer and string. The water sample is decanted from the bailer into laboratory-provided containers (appropriate for the analyses required) so that there is no headspace in the containers. Samples collected for benzene, toluene, ethylbenzene, xylene, and total petroleum hydrocarbons as gasoline analyses are collected in 40-milliliter vials fitted with Teflon® septum lids. Samples are preserved with hydrochloric acid (HCL) to a pH of less than 2. Dissolved metals samples are filtered through a 0.45-micron paper filter in the field and preserved as required before submitting to the laboratory for analyses. All samples are labeled immediately upon collection and logged on the chain-of-custody record. Sample label and chain-of-custody recorded information includes the project name and number, sample identification, date and time of collection, analyses requested, and the sampler's name. Sample bottles are placed in plastic bags (to protect the bottles and labels) and on ice (frozen water) in an insulated cooler and are shipped under chain-of-custody protocol to the laboratory.

The chain-of-custody record documents who has possession of the samples until the analyses is performed. Other pertinent information is also noted for the laboratory use on the chain-of-custody record.

Trip blanks (TBLBs) are used for each project as a quality assurance/quality control measure. The TBLBs are prepared by the laboratory and are placed in the insulated cooler and accompany the field samples throughout the sampling event.

GROUNDWATER SAMPLING - Task Nr: 03054300 [Quarterly]

SITE ADDRESS: 2633 Telegraph Avenue, Oakland, CA

cc: Melissa Gossell, Doug Gay

Notify Tom Peacock 72 hrs in advance (510) 567-6782 DONE: 5/6/99 @ 1:30 gossell

During any sampling activities, a minimum work zone will be defined by a 10ft by 10ft square centered around the monitor well and marked with 36" high orange traffic cones with flag poles and flags placed in the center of the cone and caution tape stretched between the cones. Employees will be constantly aware of the public access to the work zone and keep them within the outer perimeter of the cones and caution tape at all times.

BRING 9/16 BOLTS FOR ALL 8 WELLS. Need three (3) new drums for this site.

1. MARCH (1st)/AUG (3rd): Monitor and sample all wells (MW-1 through MW-9 and EW-1) in the following order: MW-5, MW-1, MW-6, MW-7, MW-8, MW-4, MW-2, MW-9, MW-3 and the extraction well (EW-1) located next to MW-3. USE DISPOSABLE BAILERS.

JUNE (2nd)/DEC (4th): Monitor all wells (MW-1 through MW-9, and EW-1). Sample seven (7) wells in the following order: MW-9, MW-1, MW-8, MW-2, MW-4, MW-3 and EW-1. USE DISPOSABLE BAILERS. Collect six (6) 40ml, HCL-preserved VOAs from all wells.

2. Record DTW, DTP, pH, Conductivity and temperature. NOTE: Recharge DTW.

---------------------------	--------	--------	--------	--------	--------	--------

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

** MS=Matrix Spike, MSD=MS Duplicate, RPD=Relative % Difference
