Comments:

Mr. Gholami -
Enclosed please find the Final Fourth Quarter Groundwater Monitoring and Sampling Report dated January 4, 2000 regarding Former Sears Store 1058, located at 2633 Telegraph Avenue in Oakland, CA. If you have any questions, please don't hesitate to contact me at (925) 288-2024.

Sincerely,
IT Corporation

David A. Bero
West Zone Project Manager

Subject: Fourth Quarter 1999, Groundwater Monitoring and Sampling Report
Former Sears Auto Center No. 1058, 2600 Telegraph Avenue, Oakland, California
IT Corporation Project 1176603

Dear Mr. Gholami:

On behalf of Sears, Roebuck and Co., IT Corporation presents the quarterly groundwater monitoring data collected from the above referenced site on October 26, 1999. The ten groundwater monitoring wells were gauged to determine depth to groundwater and to check for the presence of separate-phase petroleum hydrocarbons. Separate-phase hydrocarbons were detected in monitoring well MW-3 only. A potentiometric surface map is provided in Attachment 1, Figure 1. Groundwater elevation data from monitoring wells MW-2 and MW-3 were considered anomalous and were not used in drawing the contours shown on the potentiometric surface map. A summary of historical water table elevation data is provided in Attachment 2, Table 1.

After measuring depth to water, five monitoring wells (MW-1, MW-4, MW-8, MW-9, and EW-1) were purged and sampled. Monitoring well MW-2 was not sampled because a car was parked over the well, and monitoring well MW-3 was not sampled due to the presence of separate-phase hydrocarbons. Previous analyses for dissolved hydrocarbons in monitoring well MW-3 indicate that the product is predominantly motor oil. Field data sheets and groundwater monitoring and sample collection protocol are provided in Attachment 3. The groundwater samples were analyzed for total petroleum hydrocarbons as gasoline (TPH-g) and total extractable petroleum hydrocarbons as motor oil (TPH-mo) using Environmental Protection Agency (EPA) Method 8015 modified, and for methyl tert-butyl ether (MTBE) and dissolved benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8020. Confirmation analysis of MTBE was performed for samples collected from two wells using EPA Method 8260A.

Static groundwater levels for the fourth quarter 1999 ranged from 12.75 to 16.03 feet above mean sea level (an average of 12.16 feet below top of casing). Groundwater elevations have decreased by approximately 0.12 foot since third quarter 1999 (August 10, 1999). The apparent groundwater flow is to the south at an average hydraulic gradient of 0.017 foot per foot, which is consistent with previous quarterly data.

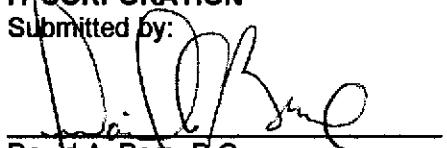

Benzene was not detected in the groundwater samples. MTBE was detected by confirmation analysis at a low concentration in monitoring wells MW-4 and MW-9. The MTBE detections were barely above the reporting limit of 2.0 micrograms per liter (ug/L). No MTBE was detected in any of the other samples. Monitoring wells MW-1, MW-8, MW-9, and EW-1 contained dissolved TPH-g, and monitoring wells MW-4 and EW-1 contained dissolved TPH-mo. A summary of the groundwater analytical results is provided in Attachment 2, Table 2. A distribution map of dissolved benzene, TPH-g, TPH-mo, and MTBE concentrations is provided in Attachment 1, Figure 2.

Groundwater elevation and analyte concentration versus time data are illustrated in Graphs 1 through 10 (Attachment 4). Hydrocarbon concentrations below detection limits are not shown on the graphs. Laboratory reports and chain-of-custody documents are provided in Attachment 5.

Historical monitoring data indicate that the thickness of separate-phase hydrocarbons in MW-3 has averaged less than 0.05 foot, and the lateral extent of the product is limited to the vicinity of MW-3; therefore, the volume of separate-phase hydrocarbons at the site is estimated to be small, less than 5 gallons. In a more aggressive attempt to remove the remaining separate-phase hydrocarbons from the vicinity of MW-3, periodic short-term use of a vacuum truck is being considered. The persistence of the thin layer of motor oil appears to be the only factor keeping this site from achieving closure. Concentrations of dissolved BTEX and MTBE have been virtually below detection limits in all site-related monitoring wells for several years.

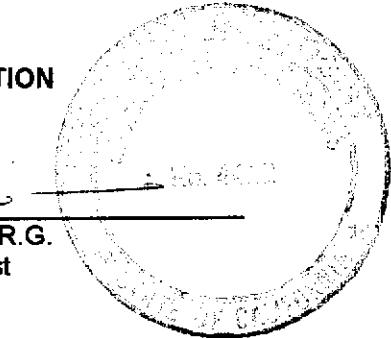

If you have any comments or questions, please contact David Bero at (925) 288-2024.

Sincerely,
IT CORPORATION

Notes:

- = No data for the cell, including "not analyzed for this constituent"
- < = Compound was not detected above the laboratory reporting limits.
- mg/l = Milligrams per liter
- TPH = Total petroleum hydrocarbons
- ND = Non-detectable (Detection limits for each metal are listed in laboratory reports.)
- SPH = Separate phase hydrocarbon
- NS = Not sampled
- * = Water samples were not filtered; analytical results represent total metals present, not dissolved concentrations
- ** = Uncategorized hydrocarbon compound not included in this hydrocarbon concentration.
- a = Dissolved lead
- b = Dissolved lead only analyte detected
- c = Dissolved lead, cadmium, total chromium, nickel, and zinc
- d = Cadmium only analyte detected
- e = Hydrocarbon pattern not characteristic of motor oil
- f = Uncategorized compounds included in concentration
- g = Zinc only analyte detected
- h = Chromium only analyte detected
- i = Duplicate sample result from EPA Method 8260A
- MTBE = Methyl Tert-Butyl Ether

**Groundwater Monitoring and Sample Collection
Protocol and Field Data Sheets**

IT CORPORATION GROUNDWATER MONITORING AND SAMPLE COLLECTION PROTOCOL

Groundwater Monitoring

Groundwater monitoring is accomplished using an INTERFACE PROBE™ Well Monitoring System. The INTERFACE PROBE™ Well Monitoring System is a hand held, battery-operated device for measuring the depth to separate-phase hydrocarbons and depth to water. The INTERFACE PROBE™ Well Monitoring System consists of a dual-sensing probe that utilized an optical liquid sensor and electrical conductivity to distinguish between water and petroleum products.

Monitoring is accomplished by measuring from the surveyed top of well casing or grade to groundwater and separate-phase hydrocarbons if present. The static water elevation is then calculated for each well and a potentiometric surface map is constructed. If separate-phase hydrocarbons are detected, the water elevation is adjusted by the following calculation:

$$\text{(Product thickness)} \times (0.8) + \text{(Water elevation)} = \text{Corrected water elevation}$$

Groundwater monitoring wells are monitored in order of wells with lowest concentrations of volatile organic compounds to wells with the highest concentrations, based upon historical concentrations. If separate-phase hydrocarbons are encountered in a well, the product is visually inspected to confirm and note color, amount, and viscosity. Monitoring equipment is washed with laboratory grade detergent and rinsed with distilled or deionized water before monitoring each well.

Groundwater Sampling

Before groundwater samples are collected, sufficient water is purged from each well to ensure representative formation water is entering the well. Wells are purged and sampled in the same order as monitoring, from wells with the lowest concentrations of volatile organic compounds to wells with the highest concentrations. Wells are purged using either a polyvinyl chloride (PVC) bailer fitted with a check valve or with a stainless steel submersible Grundfos pump. The purge equipment is decontaminated before use in each well by washing with laboratory grade detergent and tripled rinsing with deionized or distilled water. A minimum of 3 well-casing volumes of water are removed from each well while pH, electrical conductivity, and temperature are recorded to verify that "fresh" formation water is being sampled and the parameters have stabilized. If the well is low yielding, it may be purged dry and sampled before 3 casing volumes are purged. The wells are then allowed to recharge to approximately 80 percent of the initial water level before a sample is collected.

Groundwater samples are collected from each well using a new, prepackaged disposable bailer and string. The water sample is decanted from the bailer into laboratory-provided containers (appropriate for the analyses required) so that there is no headspace in the containers. Samples collected for benzene, toluene, ethylbenzene, xylene, and total petroleum hydrocarbons as gasoline analyses are collected in 40-milliliter vials fitted with Teflon® septum lids. Samples are preserved with hydrochloric acid (HCL) to a pH of less than 2. Dissolved metals samples are filtered through a 0.45-micron paper filter in the field and preserved as required before submitting to the laboratory for analyses. All samples are labeled immediately upon collection and logged on the chain-of-custody record. Sample label and chain-of-custody recorded information includes the project name and number, sample identification, date and time of collection, analyses requested, and the sampler's name. Sample bottles are placed in plastic bags (to protect the bottles and labels) and on ice (frozen water) in an insulated cooler and are shipped under chain-of-custody protocol to the laboratory.

The chain-of-custody record documents who has possession of the samples until the analyses is performed. Other pertinent information is also noted for the laboratory use on the chain-of-custody record.

Trip blanks (TBLBs) are used for each project as a quality assurance/quality control measure. The TBLBs are prepared by the laboratory and are placed in the insulated cooler and accompany the field samples throughout the sampling event.

GROUNDWATER SAMPLING - Task Nr: 03054300 [Quarterly]

SITE ADDRESS: 2633 Telegraph Avenue, Oakland, CA

cc: Melissa Gossell, Dave Poley

Notify Anir Gholami 72 hrs in advance (510) 567-6786 DONE: 10/21/99 *@ 3:45
left message*

During any sampling activities, a minimum work zone will be defined by a 10ft by 10ft square centered around the monitor well and marked with 36"-high orange traffic cones with flag poles and flags placed in the center of the cone and caution tape stretched between the cones. Employees will be constantly aware of the public access to the work zone and keep them within the outer perimeter of the cones and caution tape at all times.

BRING 9/16 BOLTS FOR ALL 8 WELLS. Need three (3) new drums for this site.

1. MARCH(1st)/AUG(3rd): Monitor and sample all wells (MW-1 through MW-9 and EW-1) in the following order: MW-5, MW-1, MW-6, MW-7, MW-8, MW-4, MW-2, MW-9, MW-3 and the extraction well (EW-1) located next to MW-3. USE DISPOSABLE BAILERS.

JUNE(2nd)/DEC(4th): Monitor all wells (MW-1 through MW-9, and EW-1). Sample seven (7) wells in the following order: MW-9, MW-1, MW-8, MW-2, MW-4, MW-3 and EW-1. USE DISPOSABLE BAILERS. Collect six (6) 140ml, HCL-preserved VOA's from all wells.

2. Record DTW, DTP, pH, Conductivity, temperature and dissolved oxygen.
NOTE: Recharge DTW.
