Dear Mr. Detterman:

PES Environmental, Inc. (PES) has prepared this Remedial Progress Report (RPR) No. 4 on behalf of Anton Emeryville, LLC (Anton) to fulfill the monthly remedial progress reporting requirement¹ requested by Alameda County Environmental Health (ACEH) for operation of the soil vapor extraction (SVE) system at 6701, 6705, and 6707 Shellmound Street in Emeryville, California (collectively, the subject property or site). PES understands Anton is currently under contract to purchase the subject property and intends to redevelop the site for multi-family high density residential purposes.

This RPR summarizes operation and maintenance (O&M) of the SVE system during the subject reporting period, and includes:

1. A summary description of SVE monitoring activities during the subject reporting period (January 16 through February 28, 2017);

¹ ACEH, 2016. *Request for Interim Remedial Action Monitoring Plan and Schedule; SCP Case RO000548 and Geotracker Global ID T0600100894, Mike Roberts Color Production 6707 Bay Street, Emeryville, CA 94608.* November 8.

2. Summary tables and graphical presentation of laboratory analytical data for vapor samples; and
3. Anticipated activities for the following reporting period.

Summary of SVE Operations

During this reporting period the SVE system was operated in accordance with methods and procedures for routine operation, maintenance, and monitoring as described in the O&M Plan². Routine O&M activities are performed by Environmental Engineering, Consulting, and Remediation, Inc. (E2CR). Weekly compliance monitoring of the SVE system was conducted during the reporting period in accordance with the Permit to Operate (PTO) permit issued on February 2, 2017 by the Bay Area Air Monitoring District (BAAQMD).

On February 3, 2017, all SVE wells were turned on to permit a scheduled SVE well soil vapor sampling event; however, water intrusion in several wells (primarily SVE-1 and SVE-8) required a temporary unplanned shutdown of the system. All wells except SVE-1 and SVE-8 resumed operation on February 6, 2017.

The SVE system was shut down on February 28, 2017, based on low concentrations of vinyl chloride detected in vapor samples collected from SVE wells on February 9, 2017. ACEH was notified by PES prior to the shutdown of the SVE system.

Summary of SVE Monitoring

Monitoring points near each wellhead, between vessels, and at multiple points past the air inlet valve are monitored. Influent, mid-point, and effluent monitoring were conducted during the reporting period in accordance with the PTO permit.

Tabulated field measurements of SVE operation for this reporting period are attached, and consist of:

- SVE operational data, presented in Table 1; and
- Field measurements of individual SVE well vacuum³ and total VOCs⁴, presented in Table 2.

SVE System Observed Vacuum and Flow Rate

During the reporting period, observed operating vacuum ranged from 4.08 to 4.89 inches of mercury.

SVE influent flow rate is estimated utilizing the blower manufacturer curve based on measured vacuum at an influent sample port upstream of the blower. As shown in Table 1, average operating flow rates during the reporting period ranged from 760 to 785 standard cubic feet per minute (scfm).

Vacuum at Vapor Extraction Wells

Table 2 summarizes vacuum observations at each extraction well. Observed vacuum at wells during the reporting period were consistent with prior field measurements indicating well-distributed vacuum pressure through the SVE well network (i.e., similar vacuum at each well).

Estimated Cumulative Mass Removal

Based on compliance sample results⁵ the estimated cumulative mass of vinyl chloride extracted since commencement of SVE to the end of this reporting period is 0.39 pounds (Table 1). PID readings of total VOCs in influent vapor collected during SVE system compliance monitoring (Table 1) were less than the operating range of the field PID (measurements displayed in minimum of 0.1 parts per million by volume [ppmv]).

Laboratory Analytical Results for SVE Well Vapor Samples

Vapor samples were collected on February 9, 2017 from 17 extraction wells (SVE-2 through SVE-7, and SVE-9 through SVE-19⁶). The samples were analyzed for VOCs using U.S. Environmental Protection Agency Test Method TO-15 by TestAmerica Laboratories, Inc. of Sacramento, California. Laboratory analytical results for detected VOCs are presented in Table 3. The laboratory analytical report and chain-of-custody documentation are provided in Appendix B.

A time-concentration chart of vinyl chloride concentrations in SVE wells with the highest baseline concentrations of vinyl chloride (vapor samples from all wells collected on October 31, 2016) is presented as Plate 2. Risk-based target cleanup levels (TCLs) for

⁵ Based on influent vapor samples collected by E2CR on November 28, 2016 and December 5 and 16, 2017.

⁶ No vapor samples were collected from SVE wells SVE-1 and SVE-8 on February 9, 2017 due to water intrusion into these wells.

vinyl chloride, presented in the November 2016 Human Health Risk Assessment Report⁷, are also graphically indicated on Plate 2. As shown on Plate 2 and Table 3, concentrations of vinyl chloride have steadily decreased since commencement of SVE operation as an interim remedial action (IRA) on November 8, 2016, and the reported concentrations of vinyl chloride were below the most conservative TCL (i.e., 1×10^{-6} human health risk level) of 47 micrograms per cubic meter of air ($\mu\text{g}/\text{m}^3$).

As such, based on the February 9, 2017 vapor sample results indicating that the SVE system had effectively reduced soil vapor concentrations to below applicable TCLs, the SVE system was shut down on February 28 to permit vapor rebound testing. PES recommends conducting the rebound sampling event after a minimum 30 consecutive days of shut down.

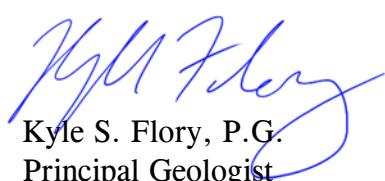

Very truly yours,
