Re: **Former Chevron Service Station #9-5630  
997 Grant Avenue, San Lorenzo, California**

Dear Ms. Shin:

Enclosed is a revised Health Risk Evaluation to Chevron's original Health Risk Evaluation, dated December 12, 1995. This revised Health Risk Evaluation was done to address the comments noted in your letter of May 17, 1996, and after review of the Health Risk Evaluation by your office.

This Health Risk Evaluation-Addendum report, dated July 2, 1996, addresses the four concerns that were raised in the review of the original Health Risk Evaluation. These concerns are:

1. Residential exposure scenario.
2. Ingestion scenario for construction workers.
3. Children scenarios.
4. SESOIL "crack factor".

Under the Residential Exposure Scenario, the revised benzene risk levels ranged from  $3 \times 10^{-8}$  to  $8 \times 10^{-11}$  to  $4 \times 10^{-12}$  for the inhalation, dermal, and ingestion pathways. These results are consistent with the original model results that ranged from  $3 \times 10^{-8}$  to  $8.6 \times 10^{-11}$ .

For the Ingestion Scenario, the revised benzene risk levels for the inhalation, dermal and ingestion pathways were calculated from  $4 \times 10^{-7}$  to  $3 \times 10^{-10}$  to  $4.5 \times 10^{-12}$ . These values were higher than originally calculated, but are still below the  $1 \times 10^{-6}$  risk threshold for benzene exposure.

For the Children Scenario, the exposure pathways for inhalation, dermal and ingestion were calculated for benzene risk levels as  $1.5 \times 10^{-7}$  to  $4 \times 10^{-10}$  to  $4 \times 10^{-11}$ . These scenarios were not originally calculated but the risk ranges now calculated are below the  $1 \times 10^{-6}$  risk threshold and therefore, the child would not be exposed to the contaminants at this site.

For the SESOIL "crack factor"; it was not possible to incorporate a "crack factor" into the SESOIL model, and therefore the ASTM RBCA equation was used to supplement this SESOIL modeling effort in determining the risks associated with the volatilization of vapors into an enclosed space. Applying the Vfwesp equation at this site indicated that the current groundwater benzene concentration of 4.6 ppb was equal to a  $1 \times 10^{-7}$  risk.

Ms. Juliet Shin

**MEMORANDUM**

Richmond, California  
July 2, 1996

**Health Risk Evaluation - Addendum**  
**Former Chevron Station #9-5630**  
**997 Grant Avenue, San Lorenzo CA**

**Mr. Phil Briggs:**  
San Ramon, California

This memorandum is in response to the May 17, 1996 letter from Ms. Juliet Shin of the Alameda County Health Care Services, regarding their review of our December 12, 1995 Health Risk Evaluation for the above referenced site. Comments generated during their review are addressed in this Addendum to our original submittal. The revised Health Risk Evaluation (HRE) takes into account the concerns raised regarding: 1) Residential exposure duration, 2) Ingestion scenario for construction workers, 3) Soil exposure scenarios for children and 4) Addresses the "crack factor" concerns raised regarding SESOIL. Also, all soil exposure pathways (ingestion, inhalation and dermal) for Resident, Child and Construction Worker were modeled in this revised HRE and the results of these changes are discussed below.

- 1) Residential Exposure Scenario (9-5630R.SAV) - The originally modeled exposure duration was changed from 9 years to 30 years, as required by DTSC and EPA guidelines, and the associated benzene risk levels ranged from  $3 \times 10^{-8}$  to  $8 \times 10^{-11}$  to  $4 \times 10^{-12}$  for the inhalation, dermal and ingestion pathways. These results are consistent with the original model results that ranged from  $3 \times 10^{-6}$  to  $8.6 \times 10^{-11}$ . The Hazard Indices calculated for ethylbenzene, toluene and xylene were all well below 1.0.
- 2) Ingestion Scenario for Construction Worker (9-5630CW.SAV) - The soil ingestion pathway was added for a site construction and the duration of exposure for all three pathways was also changed to 30 years from 0.25 years. The resulting calculated benzene risk levels for the inhalation, dermal and ingestion pathways ranged from  $4 \times 10^{-7}$  to  $3 \times 10^{-10}$  to  $4.5 \times 10^{-12}$  for the inhalation, dermal and ingestion pathways. These values were higher than originally calculated, but are still below the  $1 \times 10^{-6}$  risk threshold for benzene exposure. The Hazard Indices for ethylbenzene, toluene and xylene were all well below 1.0.
- 3) Children Scenarios (9-5630CH.SAV) - These scenarios for soil exposure were not originally calculated and the results of conservatively modeling these exposure pathways for children gave associated risk ranges of  $1.5 \times 10^{-7}$  to  $4 \times 10^{-10}$  to  $4 \times 10^{-11}$  for the inhalation, dermal and ingestion pathways. These are below the  $1 \times 10^{-6}$  risk threshold and would not represent a threat to the health of the child exposed to the contaminants at this site. The Hazard Indices calculated for ethylbenzene, toluene and xylene were below 1.0.
- 4) SESOIL "crack factor" - It was acknowledged that SESOIL was not capable of determining the health risk associated with volatilization of contaminants from a groundwater plume beneath the site. For this reason, the ASTM RBCA Vapor Volatilization equation (VFwesp equation) for volatilization of contaminants from groundwater to enclosed spaces was modeled for this site. The VFwesp equation does include a "crack factor" for the intrusion of subsurface vapors into enclosed spaces. The VFwesp equation was described in the text and the solved equation was included with the report. The results of applying the VFwesp equation at this site indicated that

the then current groundwater benzene concentration of 4.6 ppb was equivalent to a  $1 \times 10^{-7}$  risk at this site. Therefore, as it is not possible to incorporate a crack factor into the SESOIL model, the ASTM RBCA equation was used to supplement the SESOIL modeling effort in determining the risks associated with the volatilization of vapors into an enclosed space.

Please contact me at 510-242-7086 with questions or comments regarding this addendum the Health Risk Evaluation of December 12, 1995.

Sincerely,

Curtis A. Peck  
Lead Hydrogeologist

Oral Reference Dose	mg/kg-dy	.200E+00
Inhalation Slope Factor	kg-dy/mg	-.100E+01
Inhalation Reference Dose	mg/kg/dy	.114E+00
Dermal Slope Factor	kg-dy/mg	-.100E+01
Dermal Reference Dose	mg/kg-dy	.200E+00

## Xylene

PARAMETER NAME	UNITS	VALUE
Inhalation Soil Bioavailability (-)	.100E+01	
Absorption Coefficient mg/cm^2	.100E+01	
Soil Ingestion Bioavailability (-)	.100E+01	
Oral Slope Factor kg-dy/mg	-.100E+01	
Oral Reference Dose mg/kg-dy	.200E+01	
Inhalation Slope Factor kg-dy/mg	-.100E+01	
Inhalation Reference Dose mg/kg/dy	.200E+00	
Dermal Slope Factor kg-dy/mg	-.100E+01	
Dermal Reference Dose mg/kg-dy	.200E+01	

## SUMMARY OF THE OUTPUTS

\*\*\*\*\*

NOTE: A negative RfD, SF, risk, HQ, indicates that RfD or SF was not input -- a dummy negative value was used.

## INHALATION OF SOIL EMISSIONS

	Daily Intake (mg/kg-dy)	Chronic Daily Intake (mg/kg-dy)	Life Av Daily Dose (mg/kg-dy)	Risk (-)	Hazard Quotient (-)
Benzene	.126E-04	.121E-04	.517E-05	.150E-06	-.121E-04
Ethylbenzene	.303E-05	.291E-05	.125E-05	-.125E-05	.102E-04
Toluene	.112E-04	.107E-04	.459E-05	-.459E-05	.940E-04
Xylene	.528E-06	.507E-06	.217E-06	-.217E-06	.253E-05

## DERMAL CONTACT WITH SOIL

	Daily Intake (mg/kg-dy)	Chronic Daily Intake (mg/kg-dy)	Life Av Daily Dose (mg/kg-dy)	Risk (-)	Hazard Quotient (-)
Benzene	.339E-07	.325E-07	.139E-07	.403E-09	-.325E-07
Ethylbenzene	.121E-06	.116E-06	.496E-07	-.496E-07	.116E-05
Toluene	.104E-06	.100E-06	.429E-07	-.429E-07	.500E-06
Xylene	.381E-08	.366E-08	.157E-08	-.157E-08	.183E-08

## INGESTION OF SOIL

	Daily Intake (mg/kg-dy)	Chronic Daily Intake (mg/kg-dy)	Life Av Daily Dose (mg/kg-dy)	Risk (-)	Hazard Quotient (-)
Benzene	.339E-08	.325E-08	.139E-08	.403E-10	-.325E-08
Ethylbenzene	.121E-07	.116E-07	.496E-08	-.496E-08	.116E-06
Toluene	.104E-07	.100E-07	.429E-08	-.429E-08	.500E-07
Xylene	.381E-09	.366E-09	.157E-09	-.157E-09	.183E-09

The following chemicals were selected:

Benzene  
Ethylbenzene  
Toluene  
Xylene

### Data for Fate and Transport Models

#### Sesoil Model - Deterministic

##### Model Control Parameters

Simulation Time (max=100) [years]	50
Number of soil layers	2
Sublayers in layer 1	1
Sublayers in layer 2	1
Volatile emissions:	Yes

##### Climate Parameters

Surface Temperature [C]	16
Evapotranspiration [cm/day]	0.001
Precipitation [cm/yr]	50
Storm duration [days]	2
Number of storms [yr^-1]	6
Length of Rainy Season [months]	5

##### Soil Column Data

Effective porosity [-]	0.25
Dry Wt. Soil Bulk Density [g/cm^3]	1.7
X-dimension of the source [m]	10
Y-dimension of the source [m]	10
Layer 1	
Thickness of Layer [m]	1.2
Intrinsic Permeability [cm^2]	1e-9
Fraction Organic Carbon [-]	0.05
Benzene Load [kg]	0.009
Ethylbenzene Load [kg]	0.002
Toluene Load [kg]	0.002
Xylene Load [kg]	0.031
Layer 2

Re: Response to the December 12, 1995 Health Risk Evaluation for Former Chevron Station #9-5630, located at 997 Grant Avenue, San Lorenzo, California

Dear Mr. Briggs,

This office has reviewed the December 12, 1995 Health Risk Evaluation for the above site. The following are a list of comments that should be addressed and incorporated into a revised risk evaluation:

- o The residential exposure scenario should be modeled for a 30 year, not a 9 year, exposure period, per DTSC and EPA guidelines;
- o An ingestion scenario for potential construction workers should be developed;
- o Scenarios for children should be incorporated; and
- o The SESOIL model that was used in the Risk Evaluation does not incorporate a "crack factor". Please incorporate this factor into the assessment.

Please submit a revised Health Risk Evaluation addressing the above concerns within 45 days of the date of this letter.

If you have any questions or comments, please feel free to contact me at (510) 567-6763.

Sincerely,

Juliet Shin

Senior Hazardous Materials Specialist
