**SUBJECT: SECOND QUARTER OF 1995
GROUND WATER MONITORING REPORT
JAMES RIVER CORPORATION
2101 WILLIAMS STREET
SAN LEANDRO, CALIFORNIA
ESE PROJECT NO. 65-95-022**

Dear Ms. Logan:

This report presents the results of the second quarter of 1995 ground water monitoring activities conducted by Environmental Science & Engineering, Inc. (ESE) for the James River Corporation facility at 2101 Williams Street, San Leandro, California (Figure 1). This document was prepared under the supervision of a California Registered Geologist and for the sole use of the James River Corporation and the Alameda County Health Care Services Agency (HCSA), the only intended beneficiaries of our work. No other party may rely on the information contained in this report without prior written consent of ESE.

SECOND QUARTER 1995 GROUND WATER MONITORING

Field Investigation

On May 2, 1995, ground water samples were collected from monitoring wells W-3, W-5, W-6, W-7, W-8, W-9, W-10, and B-1 for chemical analyses. All sampling equipment was decontaminated before sampling activities began and after each sampling event at each well. All ground water sampling was performed according to HCSA requirements and ESE's Standard Operating Procedure No. 3 for Ground Water Monitoring and Sampling from Monitoring Wells (Appendix A). Copies of ESE's ground water sample collection logs are presented in Appendix B.

Ms. Madhulla Logan/ACHA

June 15, 1995

Page 2

Before the eight wells were purged and sampled, water-level measurements were obtained using an electronic ground water well sounder with an accuracy of 0.01 foot. The measurements were repeated several times until consecutive measurements differed by less than 0.01 foot. The final measurements were recorded on ESE's sample collection logs.

Each well was purged of at least three well volumes of water using a decontaminated centrifugal pump. Field parameters (consisting of temperature, specific conductance, and pH) were monitored during purging and recorded on the ESE ground water sample collection logs. Samples were collected after the parameter readings had stabilized. Field parameter measurements for purged water are presented in Table 1 and on ESE's sample collection logs (Appendix B).

After purging, ground water samples were collected from each well using a new disposable Teflon bailer. To minimize the potential for cross-contamination, a new dropline and a new bailer were used for sample collection at each well. Samples collected for volatile organic analysis (VOA) were decanted into three 40-milliliter VOA vials. In addition, a one-liter amber glass bottle of ground water was collected from wells W-7 and W-8 for analysis of total petroleum hydrocarbons (as diesel and as motor oil). Samples were assigned numbers related to the well of origin, stored on ice, and delivered with a chain-of-custody record to Curtis & Tompkins, Ltd. (a state-certified laboratory) located in Berkeley, California.

One VOA trip blank was also submitted to the laboratory as a quality assurance (QA) check. The purpose of the trip blank was to identify the presence of artifact laboratory chemicals in the sample bottles or contamination of volatile chemicals during transport. This sample was entered on the chain-of-custody form and delivered to the laboratory in the cooler containing the ground water samples.

Ground Water Gradient and Flow Direction

Potentiometric surface elevations measured during the period of June 1994 to May 1995 are presented in Table 2. The direction of ground water flow during this quarter is towards the west at a gradient of approximately 0.004 foot/foot (Figure 2). Ground water flow direction and gradient data are consistent with data collected from previous monitoring periods.

Ms. Madhulla Logan/ACHA

Page 3

Chemical Analyses

Samples collected on May 2, 1995 were analyzed using EPA Test Methods 8240 and 8015. Figure 3 presents the reported concentration of analytes detected in each well. Table 3 presents reported ground water sample analytical results for the period of June 1994 through May 1995. Chemical analytes and concentrations reported in May 1995 were, in most cases, consistent with past reports. Compared to the previous monitoring report, trichloroethene (TCE) concentrations were reported to have increased in wells W-3 (from less than 5 micrograms per liter, - $\mu\text{g/L}$, to 160 $\mu\text{g/L}$), W-5 (from 290 $\mu\text{g/L}$ to 360 $\mu\text{g/L}$), and in W-9 (from 3 $\mu\text{g/L}$ to 72 $\mu\text{g/L}$). TCE concentrations decreased in wells W-6 (from 250 $\mu\text{g/L}$ to 230 $\mu\text{g/L}$) and W-7 (from 180 $\mu\text{g/L}$ to 100 $\mu\text{g/L}$). Tetrachloroethene (PCE) concentrations increased in wells W-3 (from less than 5 $\mu\text{g/L}$ to 270 $\mu\text{g/L}$) and well W-9 (from 3 $\mu\text{g/L}$ to 72 $\mu\text{g/L}$). The vinyl chloride concentration was reported to have increased in well W-3 (from less than 10 $\mu\text{g/L}$ to 28 $\mu\text{g/L}$), in W-7 (from less than 10 $\mu\text{g/L}$ to 59 $\mu\text{g/L}$), and in W-8 (from 82 $\mu\text{g/L}$ to 260 $\mu\text{g/L}$). In well W-10, the acetone concentration decreased from 47,000 $\mu\text{g/L}$ to 21,000 $\mu\text{g/L}$.

Cis-1,2 dichloroethene (DCE) concentrations were reported to have decreased in wells W-5, W-6, and W-9, and increased in wells W-3, W-7, and W-8. Carbon disulfide, 1,1-DCE, 4-methyl-2-pentanone (MIBK), and 1,1 DCA were non-detected for this sampling event.

ESE collected ground water from wells W-7 and W-8 for analysis of TPH as motor oil (TPH-MO) and diesel (TPH-D). These analyses were first performed during the June 1994 quarterly monitoring event to investigate the extent of a petroleum hydrocarbon release from the abandoned cardboard bailer vault located inside the Flexible Packaging Plant. Peaks on the chromatograph identifying both diesel and motor oil were reported by the laboratory for well W-7. The sample from well W-7 was reported to contain TPH-D and TPH-MO at 15,000 $\mu\text{g/L}$ and 9,600 $\mu\text{g/L}$, respectively. As stated in the Curtis and Tompkins report, the sample chromatogram for W-7 does not resemble the hydrocarbon standard pattern. A copy of the laboratory report and chain-of-custody documentation are presented in Appendix C.

Conclusions and Recommendations

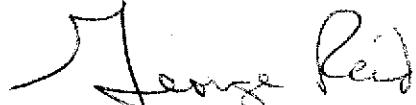

Results of quarterly ground water sampling and analysis performed during May 1995, indicate that chlorinated hydrocarbons continue to be present in the shallow ground water beneath the James River Facility in San Leandro. Findings are consistent with those collected during the past and are indicative of an upgradient offsite source of chlorinated hydrocarbons.

Ms. Madhulla Logan/ACHA

ESE Standard Operating Procedure No. 3

**ENVIRONMENTAL SCIENCE & ENGINEERING, INC.
CONCORD, CALIFORNIA OFFICE**

**STANDARD OPERATING PROCEDURE NO. 3
FOR GROUND WATER MONITORING AND SAMPLING FROM MONITORING WELLS**

Environmental Science & Engineering, Inc. (ESE) typically performs ground water monitoring at project sites on a quarterly basis. As part of the monitoring program an ESE staff member will first gauge the depth to water and free product (if present) in each well, then collect ground water samples from each well. Depth to water measurements are taken by lowering an electric fiberglass tape measure into the well and recording the occurrence of water in feet below a fixed datum set on the top of the well-casing. If free-phase liquid hydrocarbons (free product) are known or suspected to be present in the well, then an electric oil/water interface probe is used to determine the depth to the occurrence of ground water and the free product in feet below the fixed datum on the top of the well-casing. Depth to water and depth to product measurements are measured and recorded within an accuracy of 0.005-foot. The electric tape and the electric oil/water interface probe are washed with an Alconox® detergent and tap water solution then rinsed with tap water between uses in different wells.

Ground water samples are collected from a well subsequent to purging a minimum of three to four well-casing volumes of ground water from the well, if the well bails dry prior to the removal of the required minimum volume, then the samples are collected upon the recovery of the ground water in that well to 80% of its initial static level. Ground water is typically purged from monitoring wells using either a hand-operated positive displacement pump, constructed of polyvinylchloride (PVC); a new (precleaned), disposable polyethylene bailer; or, a variable-flow submersible pump, constructed of stainless steel and Teflon®. The hand pumps and the submersible pumps are cleaned between each use with an Alconox® detergent and tap water solution followed by a tap water rinse. During the well purging process the conductivity, pH and temperature of the ground water are monitored by the ESE staff member. Ground water samples are collected from the well subsequent to the stabilization of the conductivity, pH and temperature of the purge water, and the removal of four well-casing volumes of ground water (unless the well bails dry). The parameters are deemed to have stabilized when two consecutive measurements are within 10% of each other, for each respective parameter. The temperature, pH, conductivity and purge volume measurements, and observations of water clarity and sediment content will be documented by the ESE staff member on ESE Ground Water Sampling Data Forms.

Ground water samples are collected by lowering a new (precleaned), disposable polyethylene bailer into the well using new, disposable nylon cord. The filled bailer is retrieved, emptied, then filled again. The ground water from this bailer is decanted into appropriate laboratory supplied glassware and/or plastic containers (if sample preservatives are required, they are added to the empty containers at the laboratory prior to the sampling event). The containers are filled carefully so that no headspace is present to avoid volatilization of the sample. The filled sample containers are then labeled and placed in a cooler with ice for transport under chain of custody documentation to the designated analytical laboratory. The ESE staff member will document the time and method of sample collection, and the type of sample containers and preservatives (if any) used. These facts will appear on the ESE Ground Water Sampling Data Forms. ESE will collect a duplicate ground water sample from one well for every ten wells sampled at each site. The duplicate will be a blind sample (its well designation will be unknown to the laboratory). The duplicate sample is for Quality Assurance and Quality Control (QA/QC) purposes, and provides a check on ESE sampling procedures and laboratory sample handling procedures. When VOCs are included in the laboratory analyses, ESE will include a trip blank, if required, in the cooler with the ground water samples for analysis for the identical VOCs. The trip blank is supplied by the laboratory and consists of deionized water. The trip blank is for QA/QC purposes and provides a check on both ESE and laboratory sample handling and storage procedures. Since disposable bailers are used for sample collection, and are not reused, no equipment blank (rinsate) samples are collected.

EPA METHOD 8240: VOLATILE ORGANICS IN WATER

COMPOUND	Result ug/L	Reporting Limit (ug/L)
Chloromethane	ND	10
Bromomethane	ND	10
Vinyl chloride	ND	10
Chloroethane	ND	10
Methylene chloride	ND	20
Acetone	ND	20
Carbon disulfide	ND	5.0
Trichlorofluoromethane	ND	5.0
1,1-Dichloroethene	ND	5.0
1,1-Dichloroethane	ND	5.0
trans-1,2-Dichloroethene	ND	5.0
cis-1,2-Dichloroethene	ND	5.0
Chloroform	ND	5.0
Freon 113	ND	5.0
1,2-Dichloroethane	ND	5.0
2-Butanone	ND	10
1,1,1-Trichloroethane	ND	5.0
Carbon tetrachloride	ND	5.0
Vinyl acetate	ND	50
Bromodichloromethane	ND	5.0
1,2-Dichloropropane	ND	5.0
cis-1,3-Dichloropropene	ND	5.0
Trichloroethene	ND	5.0
Dibromochloromethane	ND	5.0
1,1,2-Trichloroethane	ND	5.0
Benzene	ND	5.0
trans-1,3-Dichloropropene	ND	5.0
Bromoform	ND	5.0
2-Hexanone	ND	10
4-Methyl-2-pentanone	ND	10
1,1,2,2-Tetrachloroethane	ND	5.0
Tetrachloroethene	ND	5.0
Toluene	ND	5.0
Chlorobenzene	ND	5.0
Ethyl benzene	ND	5.0
Styrene	ND	5.0
Total xylenes	ND	5.0

ND = Not detected at or above reporting limit
