

StID 203 - SLIC HISTORY

General Tire
1201 14th Avenue
Oakland, CA 94606

The facility (General Tire) at the site was primarily associated with tire sales and installation with some minor auto repair from 1960 until 1991. The property was sold in December 1998 and is currently used as a sewing factory.

In 1990-1992 a Phase I and II Environmental Site Assessment was conducted at the site. PCBs were identified in the hydraulic lift reservoirs (up to 6.4ppm Aroclor 1232), HVOCs and TPH was identified in groundwater collected beneath the site, and asbestos containing material was found in building materials. A groundwater monitoring well, MW-1, was installed in 1992. Groundwater contained 190ppb TPHd, 12ppb TCE, 15ppb 1,1-DCA, 19ppb cis-1,2-DCE, 4ppb trans 1,2-DCE, and 3ppb 1,1,1-TCA.

In September 1993, three boreholes (B-1, MW-2, and MW-3) were drilled to a depth of 16.5 feet bgs. Boreholes MW-2 and MW-3 were constructed as groundwater monitoring wells. Soil samples were collected from each borehole at 5, 10, and 15 feet bgs. Soil from B1 (immediately adjacent to well MW-1) was analyzed for PCBs. Soil from MW2 and MW3 were analyzed for VOCs and TPH. Analytical results identified low levels of VOCs and TPHmo in borehole MW-2. Soil from MW3 contained 18ppm TPHmo. and did not contain VOCs. PCBs were not detected in Boring B1.

VOCs were identified in groundwater from wells MW-1 and MW-2. It is suspected that the VOCs are from an offsite source, most probably from Style Center Cleaners, located immediately adjacent and upgradient of General Tire.

In June 1994, five additional boreholes (SB1 through SB5) were advanced to further characterize the extent of TPH and VOC contamination in soil and groundwater. The boreholes were drilled to a depth of 9 feet bgs. Soil samples were collected at 2, 5, and 9 feet bgs. Low levels of VOCs were detected in the vadose zone (2 and 5 feet bgs) in boring SB1, SB2 and SB3. These borings are located north, northeast of the General Tire building. General Tire claims that solvents were not used at their site. Low TPH constituents were identified at 5 feet bgs in boring SB1, SB4 and SB5.

After four rounds of groundwater monitoring, VOCs continue to be identified in groundwater beneath the site. A Risk-Based Corrective Action modeling was used to determine if residual VOCs in groundwater would pose a risk to human health at the site. The modeling results showed that chemical carcinogenic risk did not exceed 1.0 E-5 for indoor and outdoor air exposure.

In late 1998 all hydraulic lifts, their reservoirs and associated piping were removed. Nine soil samples were collected from the bottom of the excavation pits. Up to 23000ppm TPHmo, 1800ppm TPHd were detected in the soil samples. Additional overexcavation (laterally) was conducted in three locations (Pit C2, D1, and E). Still, 3300ppm TPHmo and 1500ppm TPHd were detected in Pit C2. Two grab groundwater samples were also

collected from Basin B1 and Basin B2. B1 contained 5200ppm TPHmo and 3700ppm TPHd.

In November 1998 additional overexcavation was conducted in Pit E and Pit C2. And, approximately 17,000 gallons of groundwater were pumped from Basin B1, B2, and Pit E. Confirmation soil and groundwater samples showed a significant decrease in concentrations of TPHd and TPHmo. Groundwater monitoring well MW-4 was installed downgradient of Basin B1 and B2.

Groundwater monitoring was conducted from March 1992 to November 1999. Very low levels of TPH have been identified in Well MW-1 and MW-4. And low levels of VOCs are detected in Well MW-1, MW-2, and MW-4. Residual chemicals of concern do not pose a risk to human health. The plume is stable and not migrating offsite. Additional monitoring is not warranted.

ell MW-1. To determine the reasonable maximum risk for the area around well MW-1, maximum concentrations detected during four sampling rounds. This simulation was performed to assess the differences in air exposure risk comparing the groundwater concentrations from monitoring well MW-1 versus ring well MW-2.

Monitoring Wells MW-1, MW-2, & MW-3, 90% Upper Confidence Limit (UCL) Values, Outdoor and Indoor Air Exposure

This simulation uses data from all three on-site monitoring wells collected during four groundwater sampling rounds. To determine more representative on-site concentrations 90% Upper Confidence Limit (UCL) groundwater values were used in the simulation. This simulation defines an area-wide risk across the Oakland General Tire site from outdoor and indoor air exposure routes. The Oakland General Tire site covers an area approximately 28,600 square feet.

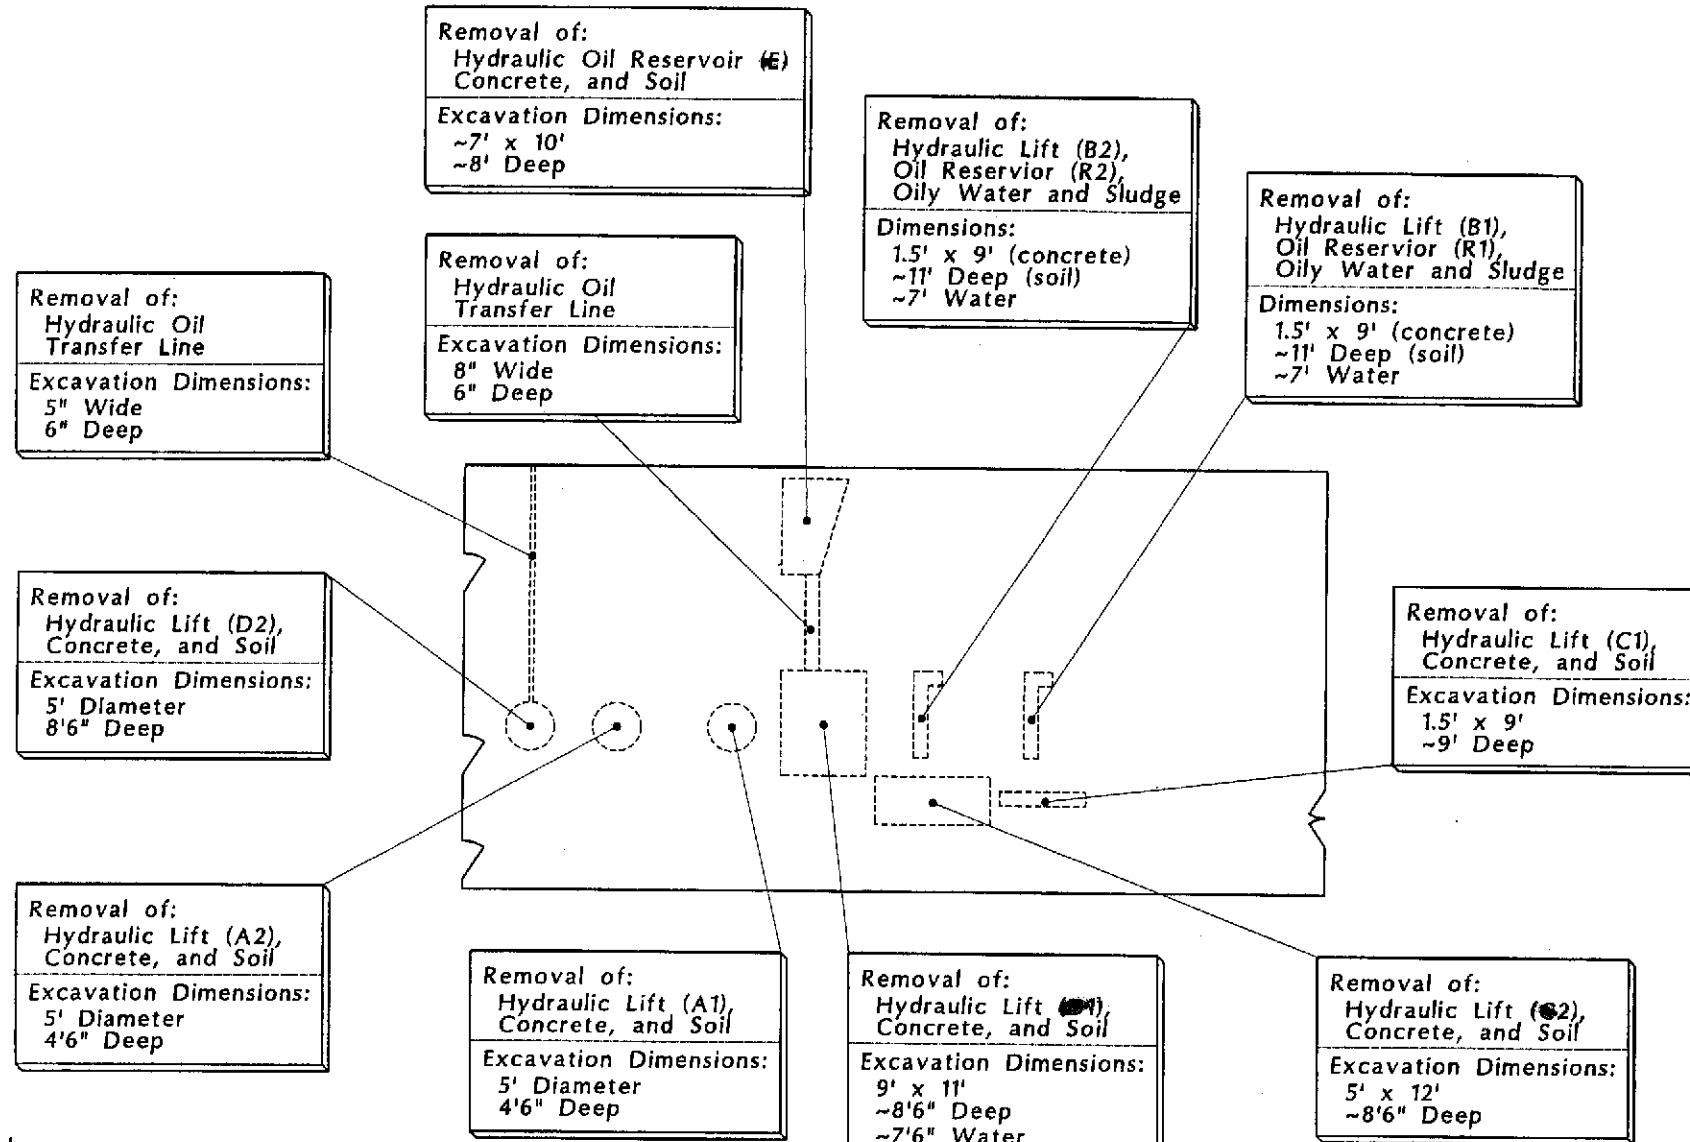

2.2 RBCA Modeling Results

The RBCA modeling effort used three simulation scenarios. The following Table 2 presents the findings of the RBCA modeling simulations with respect to carcinogenic risk associated with outdoor and indoor air exposure impacted from groundwater contamination.

Table 2
Summary of RBCA Modeling Results

RBCA Simulation	Outdoor Air Commercial Exposure Carcinogenic Risk	Exceeds $1(10)^{-5}$ Carcinogenic Risk	Indoor Air Commercial Exposure Carcinogenic Risk	Exceeds $1(10)^{-5}$ Carcinogenic Risk
Monitoring Well MW-2 Maximum Concentrations Rounds Two through Five	$4.7(10)^{-8}$ to $2.0(10)^{-10}$	No	$9.0(10)^{-6}$ to $2.6(10)^{-8}$	No
Monitoring Well MW-1 Maximum Concentrations Rounds Two through Five	$1.3(10)^{-10}$ to $2.5(10)^{-11}$	No	$1.7(10)^{-8}$ to $1.7(10)^{-9}$	No
Monitoring Wells MW-1, MW-2, & MW-3 90% Upper Confidence Limit Rounds Two through Five	$6.4(10)^{-9}$ to $1.4(10)^{-11}$	No	$1.2(10)^{-6}$ to $9.4(10)^{-10}$	No

As seen in the results presented in the appendices and summarized in Table 2, the highest carcinogenic risk is represented by the groundwater concentrations detected in monitoring well MW-2 samples with the greatest risk associated with vinyl chloride. Air exposure risk associated with groundwater concentrations detected in monitoring well MW-1 is significantly lower. Risk associated with indoor air exposure is greater than outdoor air exposure. All RBCA simulations presented in this report did not exceed $1(10)^{-5}$ carcinogenic risk with most of the site exhibiting a significantly lower risk.

notes: TEPH: Total Extractable Petroleum Hydrocarbons.

ND(0.004) = Not Detected above the laboratory detection limit in parentheses.

¹ = "Unknown hydrocarbon found in early Kerosene quantified as Kerosene."

² = "Hydrocarbon reported does not match the pattern of our (ChromaLab's) Diesel Standard."

³ = "Individual or discreet peak(s) detected in the diesel range or pattern does not resemble a typical fuel."

⁴ = Laboratory holding time exceeded. Please see 12/30/99 ChromaLab letter titled "TEPH analysis, General Tire."
