**SUBJECT: SOIL REMEDIATION & CLOSURE REPORT
5800 CHRISTIE STREET
EMERYVILLE, CALIFORNIA**

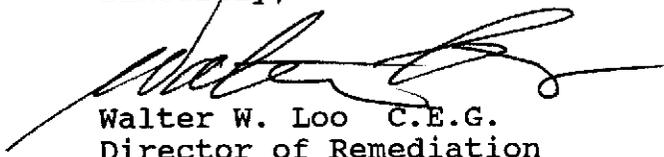

Dear Mr. Byrne:

Enclosed please find a copy of the subject soil closure report for your review.

We look forward for your approval to implement the recommended soil vapor venting system and the recommended groundwater extraction and treatment system.

If there is any question about the subject report, please contact us. We deeply appreciate your cooperation throughout this site remediation and closure effort.

Sincerely,

Walter W. Loo C.E.G.
Director of Remediation

The site is a 0.82 acre property located on the southeast corner of Christie Street and Shellmound Avenue in Emeryville, California (Figure 1-1). A one-story, 22,800 square foot industrial warehouse is the only building located on the property. The building was constructed approximately twenty (20) years ago. Croley and Herring Investment Company (CHIC) purchased the property from Milligan Spika Company in 1980. Space in the building is leased to various tenants. All tenants have been evicted as of January 1989, to clear the building for a new lease. Concrete or asphalt slabs cover the entire site except for the alley to the east of the building and Christie and Powell Streets. These areas are unpaved.

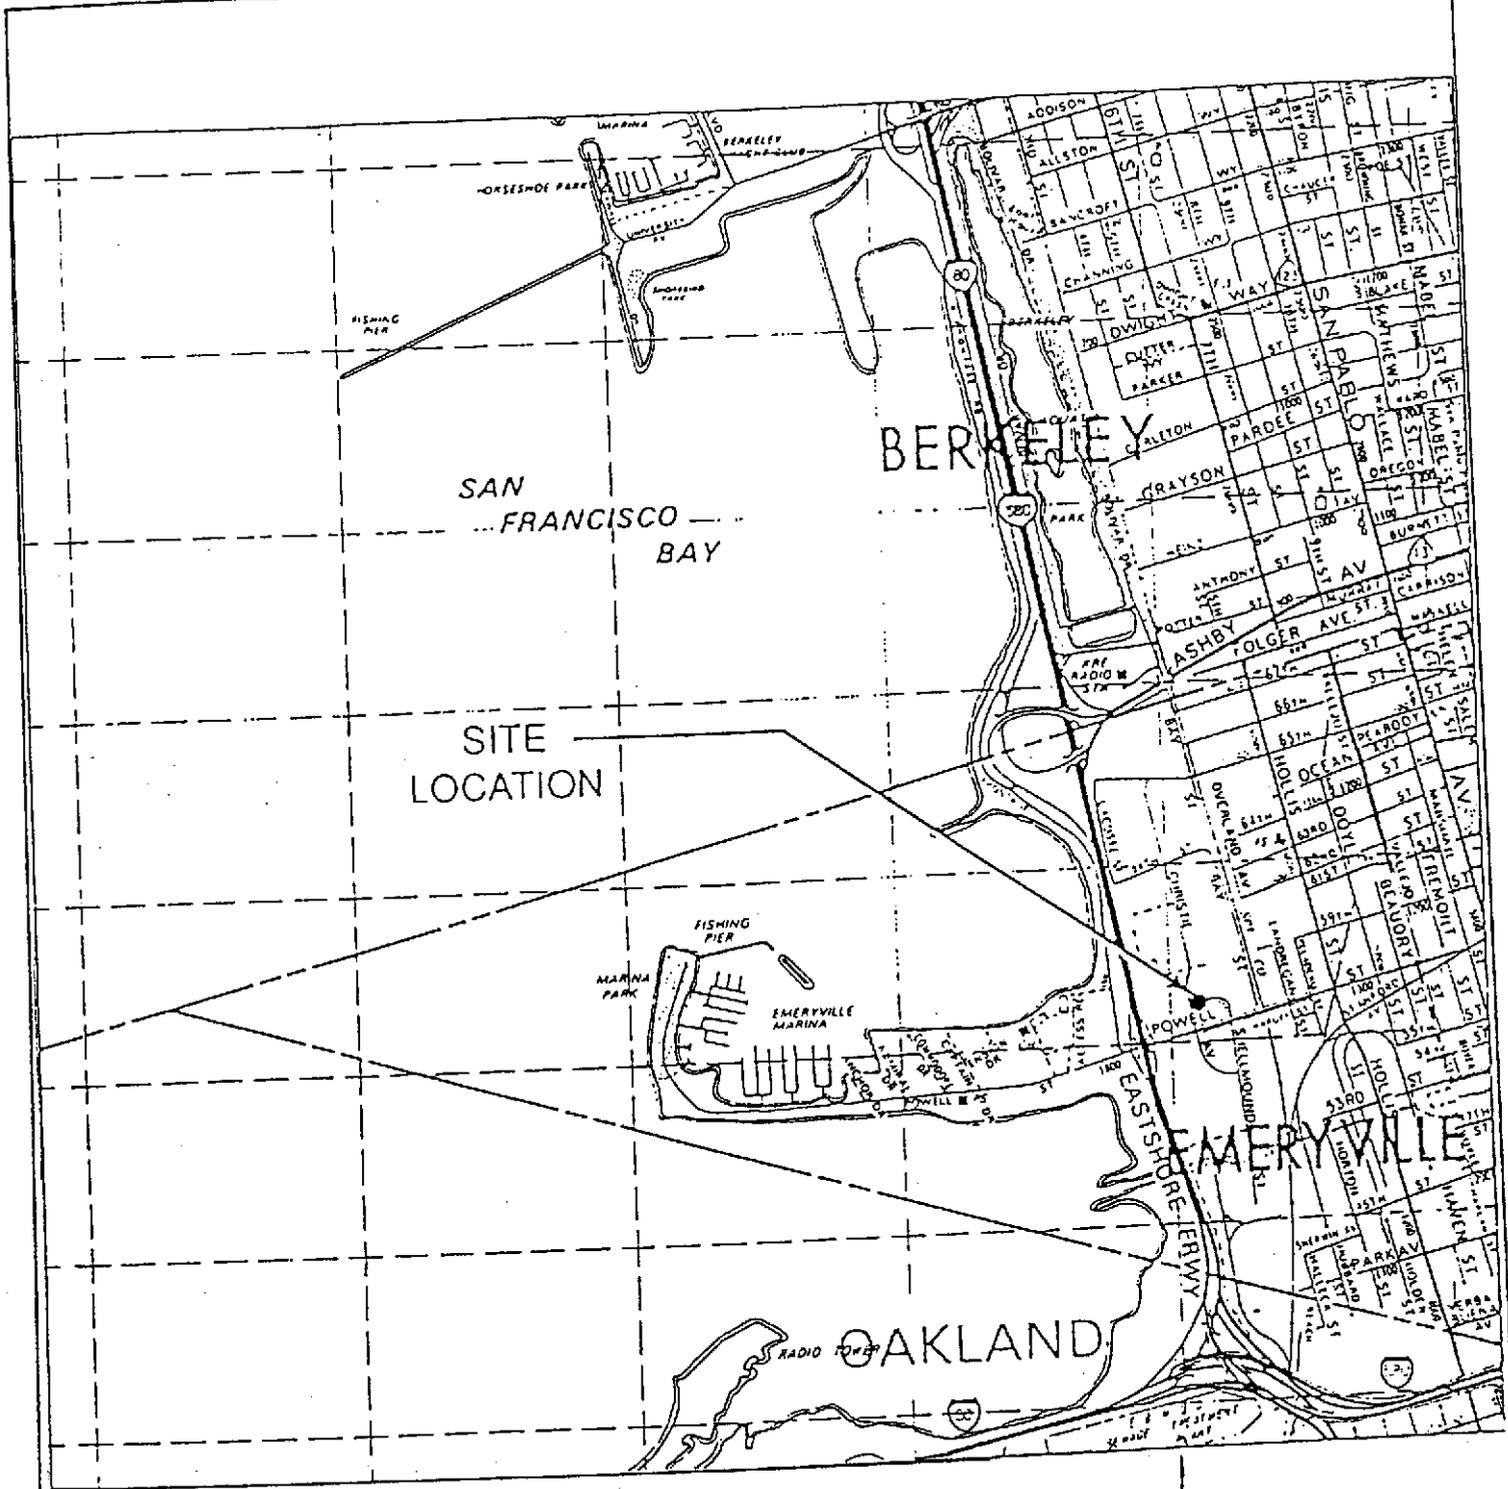

The last tenants to occupy the building were Fisher Berkeley (a manufacturer of communication equipment for health care applications), Flexo Packaging (a manufacturer of printing plates for commercial packaging applications) and Data Plus (a computer software firm). These three tenants were evicted in late 1988/early 1989. Past tenants include Milligan-Spika (a distributor of auto parts), CRT (a computer and office machine repair business) and PRT (a distributor of phonograph records). Fisher Berkeley was an original tenant.

F. P. Lathrop Company, a construction firm, owns the adjacent property to the east. In the past F. P. Lathrop Construction used the property as its corporate yard (Figure 1-2). Currently, A Sherwin-Williams wholesale paint store and the California Department of Health Services leases it.

A Mobil gas station is located to the west of the site on the opposite corner of Powell and Christie (Figure 1-2). A new shopping center, the Powell Street Plaza, is located south of the site across Powell Street.

A soil investigation of the subject facility was previously performed by Robert Gils & Associates and a site assessment report was prepared on January 20, 1989. A total of 17 soil borings were drilled (Figure 1-2).

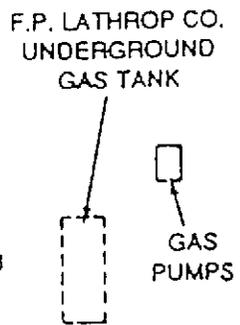

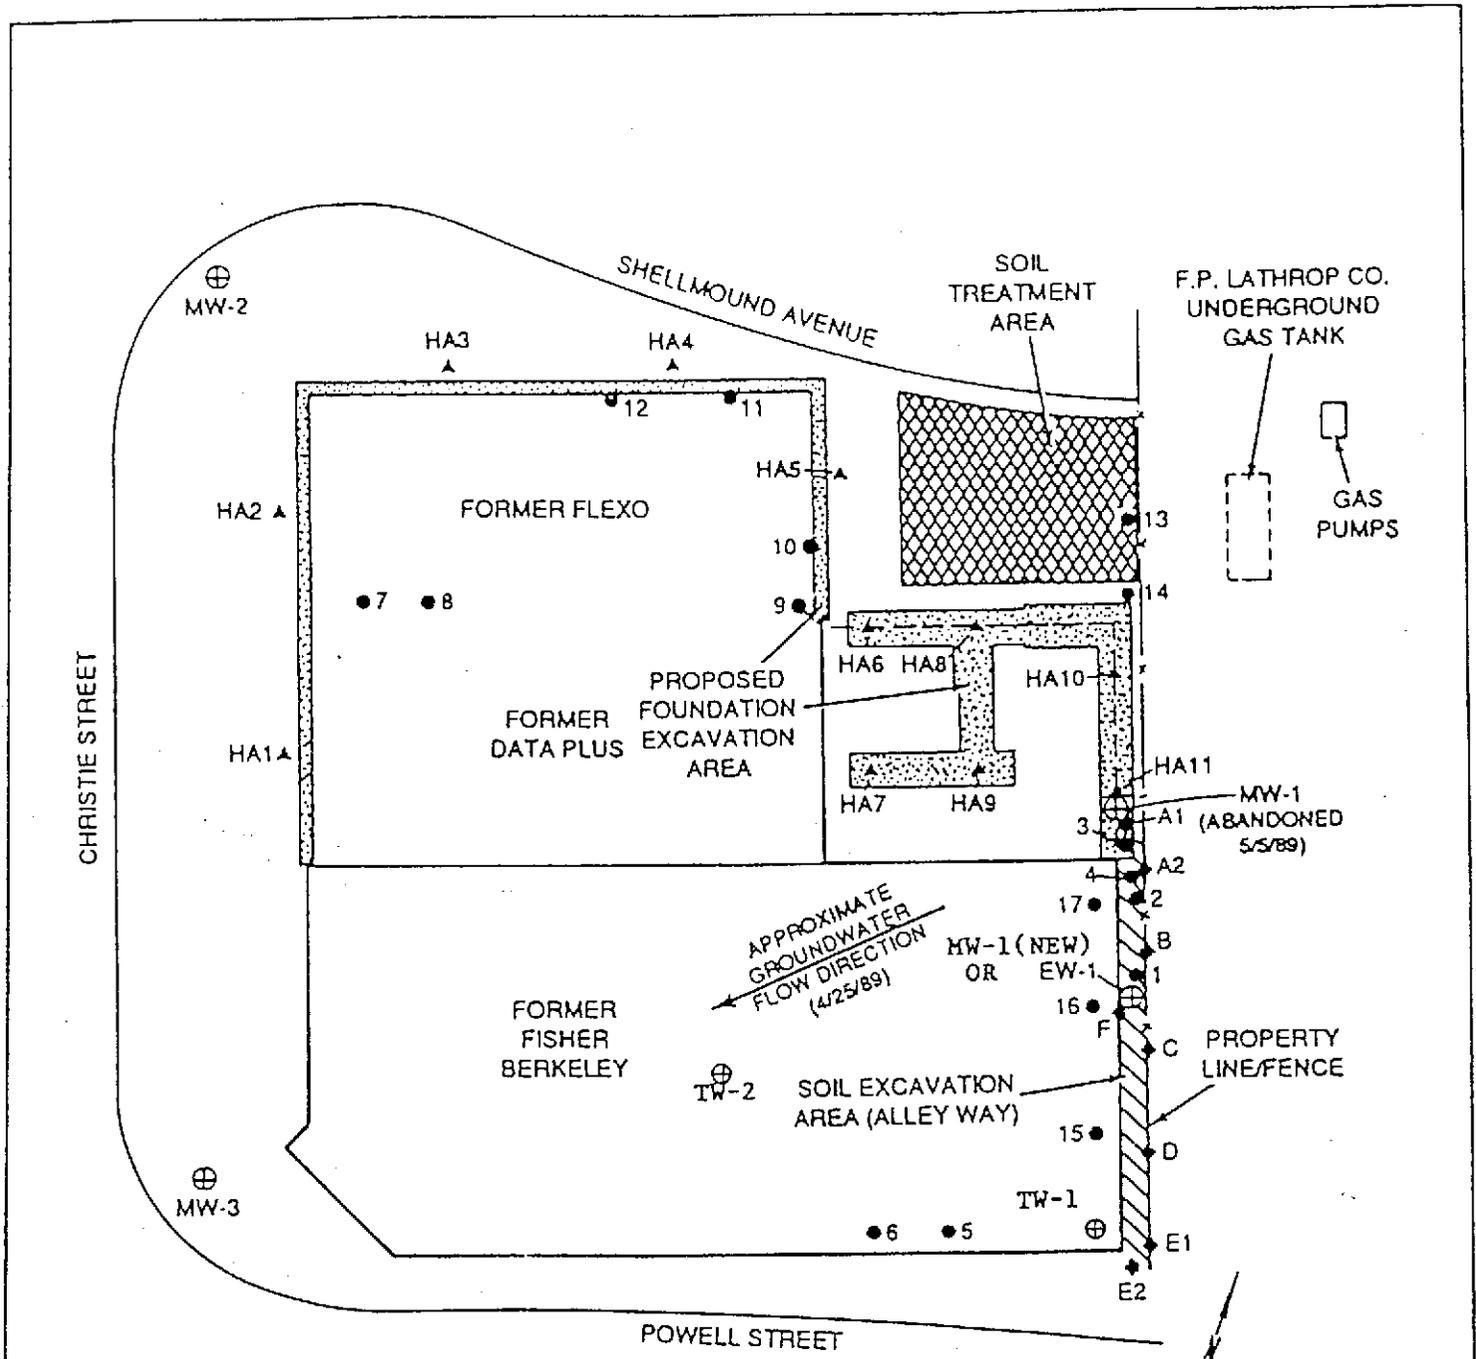

Significant soil contamination was detected at soil boring locations #1, #2, #3, and #4. Table 1-1 presents the laboratory soil analysis results performed by the Fireman's Fund Insurance Companies Environmental Laboratory in Petaluma (the name has recently been changed to AccuLab). This lab is certified by the American Industrial Hygiene Association (AIHA #103) and by the California Department of Health Services (DOHS) to analyze hazardous waste materials. EPA Method 8240 was used for samples analyzed for solvents. EPA Methods 5020/8015/8020 were used for samples analyzed for gasoline and BTEX.

NOTE: Borings #1, #2, #3, and #4 are located in the Alley Way and near the cleaning tank.

2.0 SOIL EXCAVATION

On April 5, 1989, a source area soil remediation plan was submitted to the Alameda County Health Care Services (lead agency for soil remediation) for review. Approval for the implementation of the on-site soil excavation and remediation was obtained on April 13, 1989 (Appendix A).

Prior to the source area soil excavation, permission for access was obtained from the adjacent land owner (F. P. Lathrop Co.) and the California Department of Health Services (CDOHS). In addition, full cooperation was obtained from Mr. Ric Notini and Mr. Dave Anderson of CDOHS on site clearance and the health and safety plan for excavation.

Prior to the soil excavation, the Bay Area Air Quality Management Board (BAAQMD) was notified in accordance to BAAQMD Regulation 8, Rule 40 as amended February 15, 1989 (Appendix A). Also prior to initiation of soil treatment, advance notice was provided to BAAQMD in accordance to BAAQMD Regulation 8, Rule 40.

During May 1, 1989 through May 4, 1989, the source area soil was excavated and stockpiled at the soil treatment area. A soil sample collected on the north side wall (A-1) of the excavation detected less than 0.5 ppm VOCs. A south side wall soil sample (E-2) did not detect any VOCs. Table 2-1 presents the summary of laboratory soil analysis results. The laboratory analysis and chain-of-custody record are included in Appendix B.

A total of about 80 cubic yards of contaminated soil was excavated and the excavation was backfilled and compacted to specification. The compaction tests were performed by Testing Engineers and test results are included in Appendix B. The excavated soil was placed on a lined surface and covered with plastic sheets.

3.0 SOIL TREATMENT

The estimated 80 cubic yards of excavated soil was placed on a sheet of high density polyethylene (HDPE) liner with a thickness of 0.03 inch. Berm supports were placed along the edges of the liner to contain fluids which may accumulate at the bottom of the soil unit during treatment. The soil treatment heap is comprised of seven air circulation pipes, a moisture control unit, a temperature control unit, an air blower, regulator valves, flow meters, vacuum gauges, sampling ports and six vapor phase activated carbon drums. The top of the soil heap was covered by black plastic and tarp to minimize volatilization of the soil contaminants. The dimensions of the soil heap is about 20 feet wide, 40 feet long and 4 feet tall with 6 inches of clean sand lying above and below the HDPE liner.

The total VOC's in the excavated soil range from 20.8 to 6735 parts per million (PPM) as summarized in Table 3-1. The initial baseline soil sampling was conducted on 5/5/89. One statistical representative sample was taken for each 40 cubic yards of soil. The soil sampling grid is presented in Figure 3-1. Each block represents 40 cubic yards of soil. Nine discrete soil samples are to be composited into one representative sample. The discrete sample locations are selected in the field by the radom mesh method. For soil baseline and performance characterization, discrete and composite samples were analyzed for VOC by EPA 8240 or EPA 8010/8020 method. Five specific rounds of soil samples were collected on 5/5/89, 5/23/89, 6/5/89, 6/16/89 and 6/29/89 respectively. Table 3-2 summarizes the laboratory analysis results. Laboratory analysis sheets are included in Appendix C.

Since the soil treatment is a combination of bioremediation and vapor venting, microbial plate count and fecal bacteria were also analyzed (Table 4-1).

Table 3-2 is a summary of the soil treatment soil analysis results. The average VOC concentration of 3119 ppm at source area was ultimately reduced to below 5 ppm at the soil treatment heap. The duration since initial excavation (5/1/89) through last round of soil sample (6/29/89) is about 60 days or 2 months. Figure 3-1 presents the VOC and TCE concentration reduction versus time plot on the soil remediation.

6/29/89	0.298	1.24	1.18	2.72

4.0 SOIL DECOMMISSION

The soil treatment was completed and terminated on 7/13/89. A verbal approval was obtained from Mr. Dennis Byrne of Alameda County Health Services (with the concurrence of the Bay Area Regional Water Quality Control Board) to dispose of the treated soil to a Class III landfill on 7/11/89. The West Contra Costa Landfill was contacted on 7/12/89 for approval to accept the treated soil. The final three rounds of soil laboratory analytical results and soil declassification reports were submitted to both the landfill and Alameda County Health Services. The soil treatment system was dismantled on 7/13/89. Soil disposal approval was obtained from Mr. Randy Thomas, Landfill Manager of West Contra Costa Sanitary Landfill on 7/14/89. The total volatile organic compounds in the final round (6/29/89) of 4 soil samples were all below 5 parts per million (ppm) which is about 10 times lower than the proposed 50 ppm cleanup level. The soil declassification results are included in Appendix D. Both of the soil samples taken on 6/16/89 qualify for a nonhazardous designation per Section 66696 of California code of Regulations Title 22 Division 4. Furthermore, the concentration limit for TCE in soil disposal criteria for the West Contra Costa Landfill is set at below 5 ppm. Since 6/5/89, the total VOC and TCE concentration in soil were all below 5 ppm as indicated in Figure 3-1. Also, the treated soil is free of harmful bacteria such as Fecal Coliforms and Fecal Streptococci as indicted in Table 4-1.

The 80 cubic yards of soil was transported and received by the West Contra Costa Landfill on 7/18/89. The landfill disposition receipts are included in Appendix D.

5.0 RECOMMENDATION

Based on results of soil treatment, classification of treated soil as nonhazardous material, and disposal of the nonhazardous soil to the West Contra Costa Landfill, we recommend closure of the on-site soil remediation phase of the remediation effort.

As indicated in Section 2.0, there are still residual VOC's left on the excavation wall, we propose an in-situ soil vapor extraction and treatment system for the ultimate removal of the residual VOC's which is discussed in Section 5.1.

During the site investigation, trace amount of VOC's in shallow groundwater were detected near the source area, we propose a groundwater extraction and treatment system for the groundwater remediation effort which is discussed in Section 5.2.

5.1 PROPOSED SOIL VAPOR VENTING PLAN

As indicated in Table 2-1, excavation wall soil samples B, C, D and F all showed trace level VOC's. We do not believe the lateral extents of the VOC reached far from the alley way. This is evidenced by the previous soil boring results on boring 15, 16, and 17 which were located on the other side of the wall inside the building (Figure 1-2). The same should apply to the F. P. Lathrop property side.

We propose to install 4 VOC vapor venting wells to remediate the residual VOC left in place. Figure 5-1 is the VOC vapor extraction/treatment system schematic diagram. An air emission permit application will be filed with BAAQMD prior to operation. The vapor treatment system is comprised of vapor phase activated carbon drums connected in series to eliminate VOC emission into the atmosphere.

At boreholes 13 and 14, adjacent to the L. P. Lathrop fuel tank, the low level of gasoline detected (3 to 5 ppm TPH) in soil 11 feet deep. Any vapor volatilization at these low concentrations will most likely be non-detectable by the time it reaches the ground surface. We propose no action remediation at this location.

5.2 PROPOSED GROUNDWATER REMEDIATION PLAN

Initially, three shallow groundwater monitoring wells were installed and were named as MW-1, MW-2 and MW-3 (Figure 1). The associated well logs and construction details are included in Appendix F.

Groundwater samples were collected from these wells and analyzed for EPA 8240 VOCs. Results of the laboratory analyses are included in Appendix G. No VOCs were detected in wells MW-2 and MW-3. Only 2 VOCs were detected at Well MW-1 and they were 1,1-DCA and 1,2-DCE. The detected concentrations for both VOCs were 9 parts per billion (ppb).

A groundwater level survey was performed on April 25, 1989 and the groundwater table elevations at MW-1, MW-2 and MW-3 were 3.31, 3.11 and 2.99 feet above mean sea level, respectively (Table 5-1). The groundwater flow direction was estimated as southwest towards the bay with a hydraulic gradient of 0.00145. Well MW-3 is the downgradient well.

A new groundwater extraction Well EW-1 was constructed on 5/5/89 in the source area after soil excavation and backfill were completed. A groundwater sample collected on 5/8/89 was analyzed for EPA 601 and 602 volatile organic compounds. The following volatile organic compounds were detected:

1,1 DCE	78 ppb (action level 6 ppb)
TCE	640 ppb (action level 5 ppb)
Toluene	190 ppb (action level 180 ppb)
Xylenes	170 ppb (action level 680 ppb)

Two groundwater samples were also collected in the downgradient direction of extraction Well EW-1. One of the sample locations is located at the center of the former Fisher Berkeley facility (TW-2), about 80 feet downgradient. No organic chemical compounds were detected. The other groundwater sample was taken at the southeast corner of the former Fisher Berkeley facility (TW-1). Benzene was detected at 47 ppb. The state action level of benzene is 1 ppb. Because, benzene was not found at the source area, its origin at this location is most likely from an off-site source.

It is apparent from these results that the contaminants on-site have not significantly affected the shallow aquifer. However, the 1,1-DCE, TCE and toluene concentrations are above the state action level for groundwater cleanup. We propose a groundwater extraction/treatment system be installed to clean up the minor quantity of contaminant which was detected. The treatment system will comprise of an aqueous phase activated carbon filter (Figure 5-2).

For estimation of the groundwater remediation volume, we anticipate that the maximum plume has a 60 foot radius, a saturated thickness of 15 feet, and an effective porosity of 0.10. The estimated plume volume is about 127,000 gallons. About 63,500 gallons of the plume volume is estimated to be off-site and underlying the F. P Lathrop property. Extraction Well EW-1 is capable of recovering the contaminated water off-site. The duration of treatment for one plume volume is estimated at 90 days assuming an extraction rate of 1 gallon per minute (1,440 gallons per day). Assuming a total maximum VOC concentration in groundwater at 1 ppm, the amount of VOC in the groundwater plume is estimated at a maximum of 1.1 pounds. We estimate that two 55-gallon drums of aqueous phase activated carbon would be adequate to remove the 1.1 pound of VOCs.

A waste water discharge permit application was filed with Mr. William Meckel of the East Bay Municipal Utility District (EBMUD) on 7/6/89. On 7/12/89, Mr. Meckel visited the site and mentioned a discharge permit will most likely be granted before the end of July, 1989. We are anticipating to start up, operating and testing the groundwater extraction/treatment system immediately after EBMUD permit approval. A copy of the EBMUD discharge application is included in Appendix H.

We propose the three existing wells on site EW-1, MW-2, MW-3 will be monitored and sampled on a quarterly basis and a quarterly self-monitoring report will be filed with your agency during the proposed groundwater extraction and treatment effort. When the groundwater analysis results showed levels below the action levels as indicated above for 1,1-DCE, TCE, toluene and xylenes, we propose to terminate the groundwater remediation effort and will file a groundwater closure report with your agency for site closure.

Subject: Soil Remediation at 5800 Christie Ave. Emeryville.

Dear Mr. Crowley:

Thank you for the fee deposit check, remediation action and site safety plans submitted to our office concerning the facility listed above. The plans have been reviewed by our staff and approval is granted for their implementation.

If you have any questions concerning this matter, please contact, Dennis Byrne, Hazardous Materials Specialist, at (415) 271-4320.

Sincerely,

Rafat A. Shahid, Chief,
Hazardous Materials Division

Bay Area Air Quality Management District
939 Ellis Street
San Francisco, CA 94109

Dear Mr. Feldstein:

NOTIFICATION OF INTENTION TO EXCAVATE

This letter presents Croley and Herring Investment Company's (CHIC) intention to excavate soil located on site at 5800 Christie Street, Emeryville, California. McLaren is the remediation consultant to CHIC. The scheduled starting date of this excavation is on or during the week of April 24, 1989.

The proposed total excavation will be less than 100 cubic yards of soil. Concentrations of organic compounds detected in the soil average less than 500 ppm. Organic compounds which have been detected include; Carbon Tetrachloride, Ethyl Benzene, Toluene, 1,1,1-Trichloroethane, Trichloroethene, Xylenes, and Gasoline.

Remediation action and site safety plans were submitted to and reviewed by the Alameda County Department of Environmental Health and approval was granted for their implementation (see attached letter). If you have any questions please call me at (415) 521-5200.

Sincerely,

Amy Brownell

 Emeryville, Client Job
 #59201-002

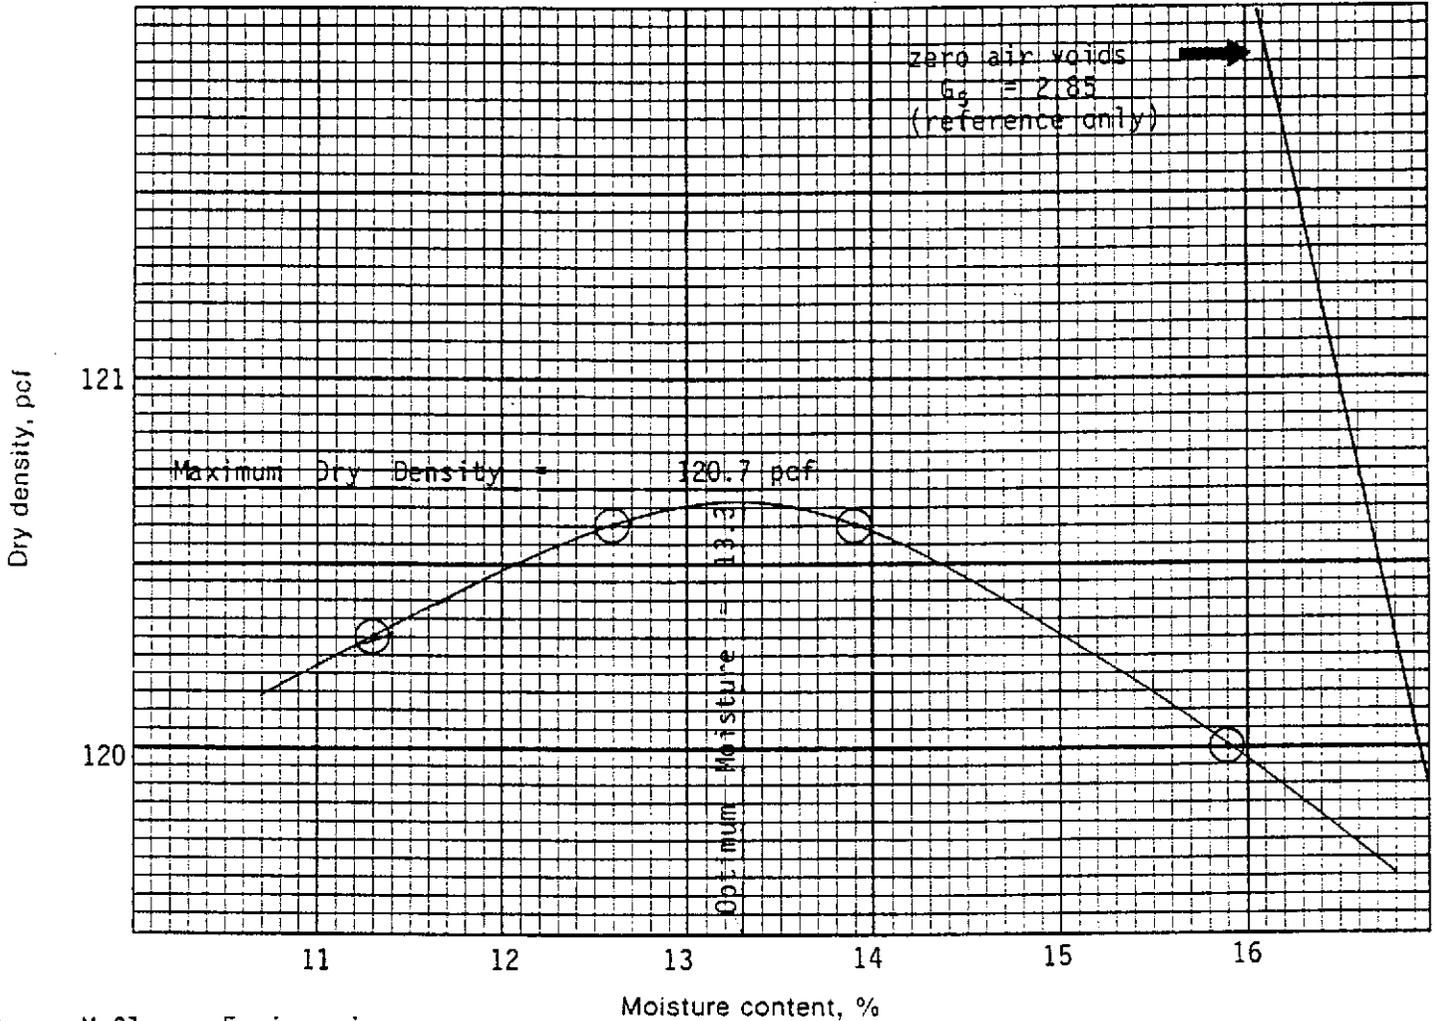

SAMPLE DATA: Sampled 5-4-89 from
 east side of building.

VISUAL CLASSIFICATION:
 Light brown sand

MAXIMUM DENSITY DETERMINATION:
 Method ASTM D1557
 Optimum Moisture, % 13.3
 Maximum Dry Density 1.93 g/cc
 (lbs. cu. ft.) 120.7 pcf

PLASTIC CHARACTERISTICS:
 Liquid Limit, %
 Plastic Limit, % Not Tested
 Plasticity Index

APPENDIX D

SOIL DECLASSIFICATION LABORATORY TEST RESULTS

**DETERMINATION OF THE HAZARDOUS
POTENTIAL OF A WASTE SAMPLE**

**Prepared for
Mobile Chem Labs, Inc.**

**Prepared by
EA Engineering, Science, and Technology, Inc.
Western Regional Operations**

**30 June 1989
70008.01**

EA performed a static, acute screening test on two soil samples (Sample #069100 and 069101) received from Mobile Chem Labs, Inc., Lafayette, California.

Test Methodology

An initial screening bioassay was performed to determine if the sample should be designated as a hazardous waste. The sample was tested using juvenile fathead minnows (Pimephales promelas) in the manner prescribed by the California Department of Fish and Game Water Pollution Control Laboratory (Polisini and Bartos 1987). Test conditions are summarized in Appendix A. Minnows were exposed to five weight/volume concentrations of the sample: 2,000, 1,750, 1,500, 1,250 and 1,000 mg/L. Dilution and control waters were a soft synthetic water formulated per EPA/600/4-85/014.

Test Results

No toxic response to the concentrations tested was demonstrated. No significant mortality occurred in any of the concentrations (Table 1). Water quality values are summarized in Table 2.

This sample qualifies for a nonhazardous designation per Section 66696 of California Code of Regulations Title 22 Division 4.

WEST CONTRA COSTA LANDFILL TREATED SOIL
APPLICATION AND DISPOSAL RECEIPTS

Croley and Herring Investment Company

July 12, 1989

Mr. Fred Chaosky
Richmond Landfill
205 41st Street
Richmond, CA 94805

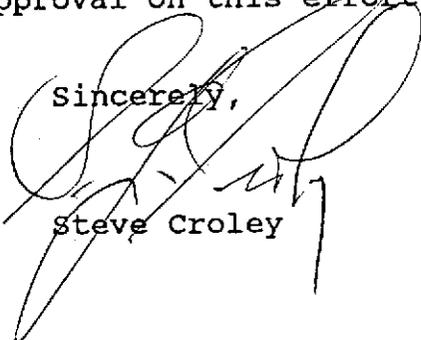

**SUBJECT: ADDITIONAL SOIL DISPOSAL
THE GOOD GUYS SITE
5800 CHRISTIE STREET
EMERYVILLE, CALIFORNIA**

Dear Mr. Chaoske:

As per our conversation, there is 80 cubic yards of soil that needs to be disposed to your landfill. Attached please find the laboratory analysis of soil from the 80 cubic yard of material. We have obtained verbal approval from Mr. Dennis Byrne of Alameda County Health for the disposal to a Class III landfill. Attached also is a toxicity criteria test results on the subject soil with a non-hazardous classification.

If you have any questions about this letter, please contact us. Thank you for your expeditious approval on this effort.

Sincerely,

Steve Croley

APPENDIX H

WASTE WATER DISCHARGE PERMIT APPLICATION

Croley and Herring Investment Company

July 6, 1989

Mr. William Meckel
East Bay Municipal Utility District
Post Office Box 24055
Oakland, California 94623

Dear Mr. Meckel:

**WASTEWATER DISCHARGE PERMIT APPLICATION - GROUNDWATER TREATMENT DISCHARGE
5800 CHRISTIE STREET, EMERYVILLE, CALIFORNIA**

Enclosed please find a copy of a wastewater discharge permit application for the subject activities. The owner of the property is Croley and Herring Investment Company and the future lessee of the facility is the Good Guys, Inc.

The proposed process involves the extraction of shallow groundwater and treatment with aqueous phase activated carbon prior to the discharge to the East Bay Municipal Utility District (EBMUD) sewer system.

The water balance is estimated at about one gallon per minute discharge rate. The groundwater plume volume is estimated at about 127,000 gallons. The duration of the treatment discharge is estimated at 3 to 12 months.

The contaminated shallow groundwater will be extracted from Well EW-1 (Figure 1). There are 5 other groundwater quality samples collected from MW-1, MW-2, MW-3, TW-1 and TW-2. Samples from MW-2, MW-3 and TW-2 showed no detectable volatile organic compounds (VOCs). MW-1 showed 18 part per billion (ppb) of total VOCs. TW-1 showed 47 ppb of total VOCs. EW-1 showed 1 ppm of total VOCs including 640 ppb of TCE, 190 ppb of toluene and 170 ppb of xylenes. The laboratory analysis sheets for these water samples are attached.

The extraction Well EW-1 is in place. The extracted groundwater will be diverted to an aqueous phase activated carbon system for removal of the VOCs. The aqueous phase activated carbon system included two 55-gallon drums of activated carbon (150 lbs each) connected in series to prevent breakthrough. The total VOCs in 127,000 gallons of groundwater (plume volume) at 1 ppm maximum strength is about 8 pounds. The adsorption capacity of each 55-gallon drum of carbon is estimate at 10 to 15 pounds of VOCs.

1311 63rd Street, Emeryville, California 94608

Mr. William Meckel
July 6, 1989
Page 2

The connection of the discharge from the activated carbon drums to the sewer is indicated in Figure 2.

There is no pretreatment system involved in this proposed treatment system.

For initial testing, the extracted groundwater and the discharge water samples will be analyzed and compared for removal efficiency. Water samples will be taken between the carbon drums and at the discharge point. No discharge will be diverted to the sewer until the laboratory result for the discharge point sample indicates non-detectable with EPA 601 and 602 method of analysis. The analysis will be performed by a certified analytical laboratory. The follow up discharge will be analyzed on a quarterly basis as with the groundwater monitoring wells on the property.

The Alameda County Health Services is the lead agency on the soil cleanup and groundwater investigation effort. The contact person is Mr. Dennis Byrne.

An unspecified source of organic solvents were discovered at the alley way (Figure 1). The contaminated soil was excavated and is currently being treated. Three permanent groundwater monitoring wells were installed plus three temporary groundwater sample point were established.

We propose to start the groundwater extraction/treatment on July 15, 1989.

We appreciate your time for reviewing this application. Please contact us for any questions and the appropriate discharge application fee.

Sincerely,

R. D. Herring

PROVISIONS

Applicant will comply with the District Wastewater Control Ordinance and all applicable rules and regulations.

Applicant will report to EBMUD, Wastewater Department any changes, permanent or temporary, to the premise or operations that significantly change the quality or volume of the wastewater discharge or deviation from the terms and conditions under which this permit is granted.

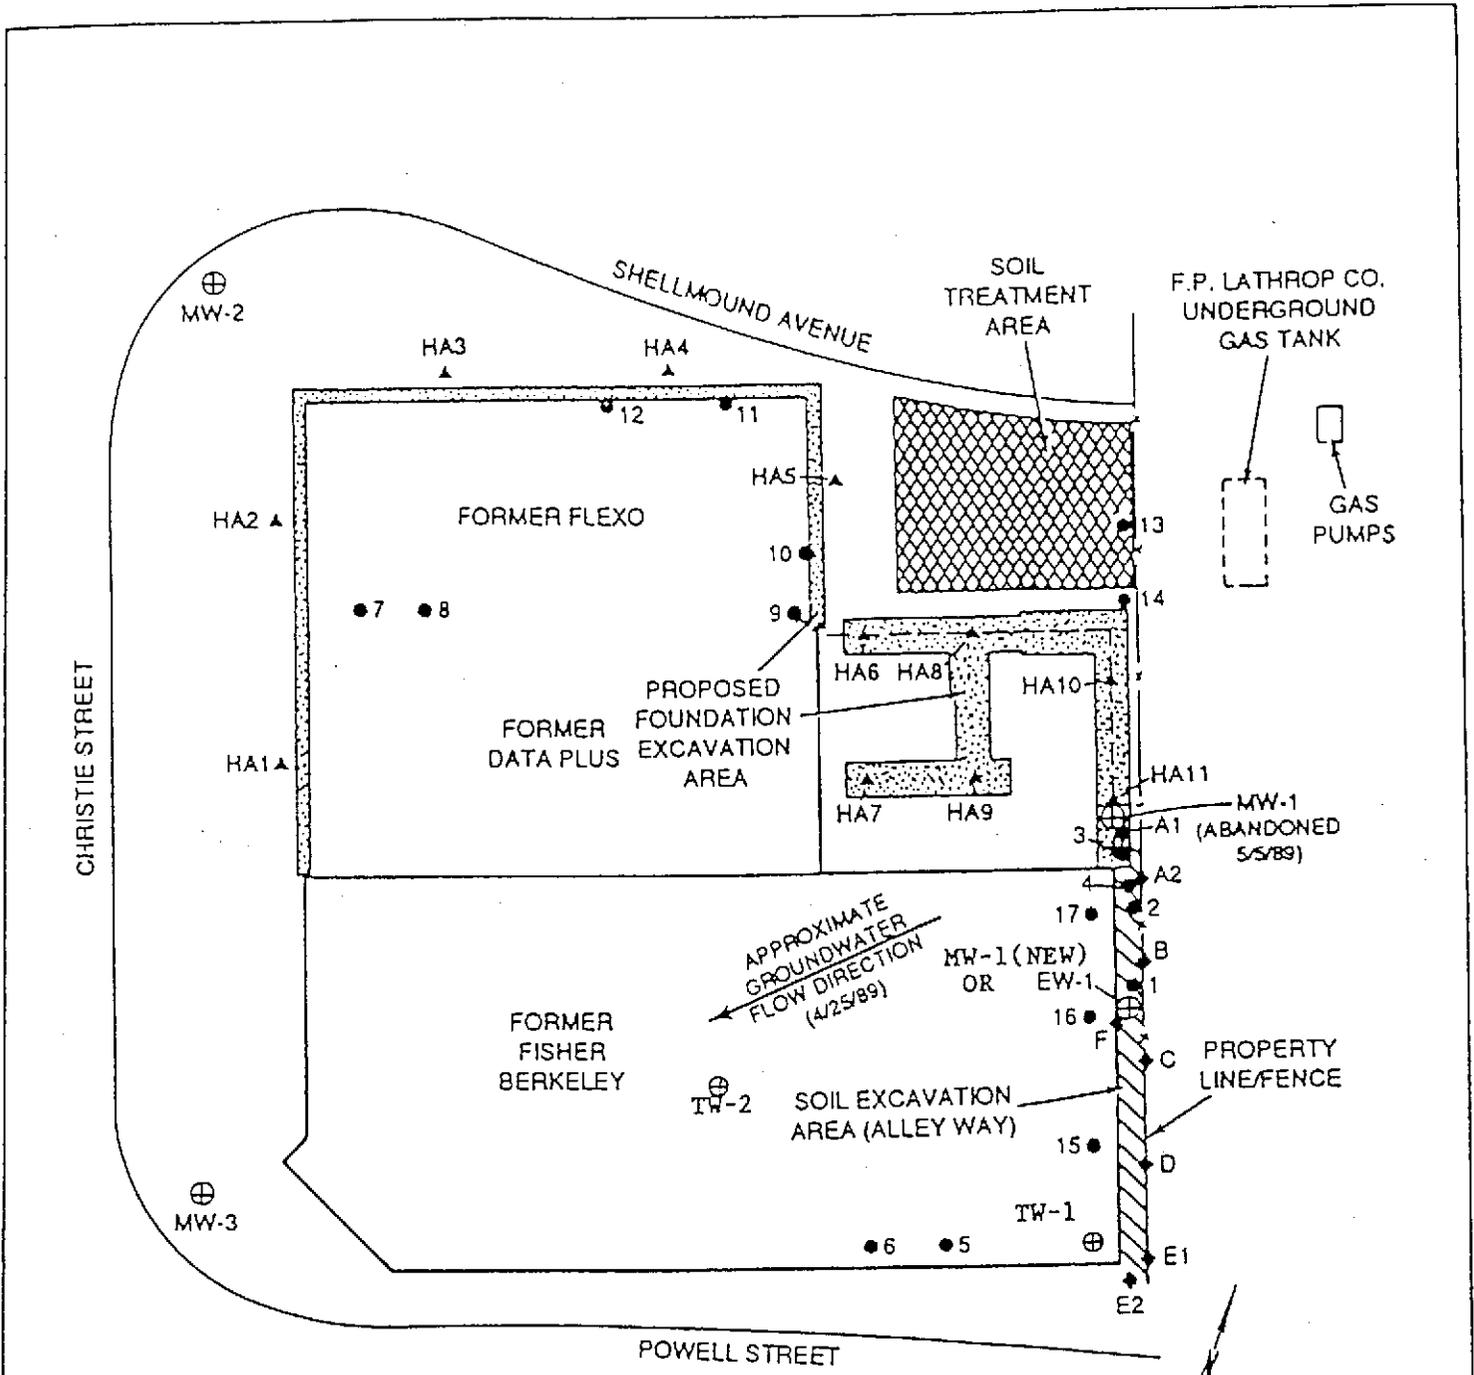

CERTIFICATION

I have personally examined and am familiar with the information submitted in this document and attachments. To the best of my knowledge the submitted information is true, accurate and complete.
