RE: Soil Remediation  
Young's Cleaners  
Foothill Square Shopping Center  
Oakland, CA

Dear Mr. Chan:

The soil remediation project is proceeding very well. The purpose of this letter is to provide you with a formal update of the progress to-date.

As AEI proceeds with the excavation soil samples are collected and screened using a flame ionization detector (FID). AEI uses the results of these screening tests to determine the approximate extent of soil contamination and to optimally collect soil samples for confirming laboratory analysis. To date AEI has collected over 200 soil samples for screening and 32 samples for laboratory samples.

In general, AEI has found that the contamination extends only to 12 feet below ground surface (bgs). AEI has encountered a stiff brown clay at 10 to 12 feet bgs, which appears to mark the extent of contamination. AEI has excavated two test pits to 18 feet bgs and has not discovered any deeper stratum of soil with elevated levels of hydrocarbons.

The exception to the generalizations of the preceding paragraph are the soils encountered during the excavation of pit E (see sketch attached). AEI encountered a light brown clayey sand at 12 feet bgs and found contamination to extend slightly deeper.

A summary of the project to date is presented below.

AEI initially excavated the first four feet of Trenches A, B, L, and M (see attached sketch). AEI proceeded to excavate Trench A and the east half of Trench B. AEI excavated to a terminal depth of 15 feet bgs in the northern third of this trench and to a depth of 12 feet bgs in the remainder of this trench. AEI extended the excavation northerly ten feet and easterly three feet over an eight foot span, in order to excavate to cleanup goals.

AEI proceeded to excavate sections L and M to twelve feet bgs. AEI found the levels of contamination to be below the action level on

---

Corporate Headquarters:

2641 Crow Canyon Rd., #5  
San Ramon, CA 94583

(310) 328-8878

the west side of this section; thus AEI terminate the excavation 10 feet east of the proposed western limit. AEI collected a total of two samples from the bottom and three samples from the south wall of this excavation.

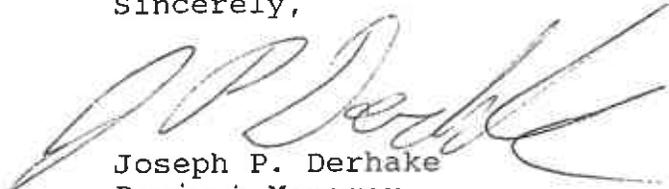

AEI is currently in the process of excavating the nine cells below the load bearing wall, cells C, D, E, F, G, H, and K. The remainder of trench B and "Area 2" (the former Hip Hop) is being excavated at the same time as the corresponding section of the nine cells under the load bearing wall. To date Cell C and Cell E are complete. Cell C was excavated to 12 feet bgs and Cell E was excavated to 18 feet bgs.

During the excavation of cell C and E the western wall of the former "Hip Hop" was found to be above the action level. AEI believes that the plume has migrated further west than expected.

AEI is currently drilling horizontally into the western wall of the excavation in the former Hip Hop, and soil samples are being collected from under the store west of the former "Hip Hop" (the Shoe Repair). We have also drilled vertically in the "breezeway" just to the west of the Shoe Repair. When we receive the results of these tests, we will need to discuss with you the possibility of having to remove the Shoe Repair and continue to excavate westerly until contamination levels below the action level are reached.

We would sincerely appreciate your written confirmation of the procedures utilized to date to satisfy Agency requirements. Your thoughts on the necessity to extend work westerly under the Shoe Repair would also be appreciated. We look forward to hearing from you on this matter at your earliest convenience.

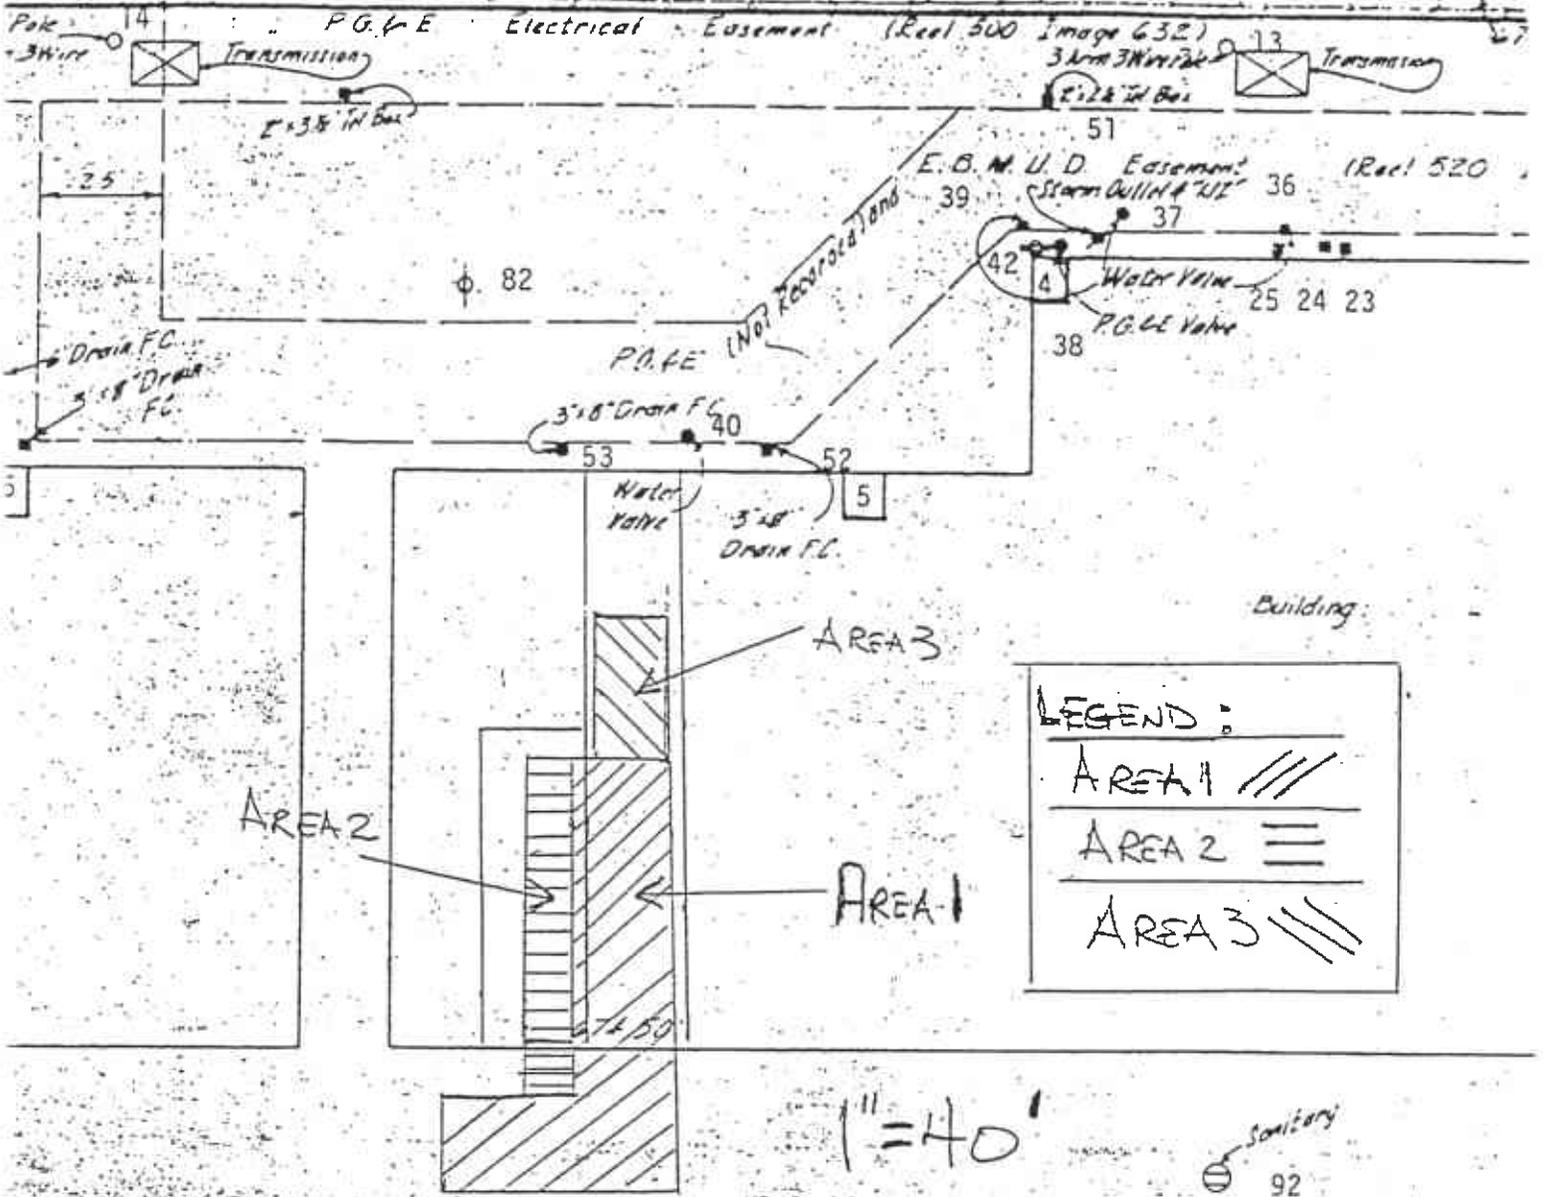

Sincerely,

Joseph P. Derhake  
Project Manager
