Lead Contaminated  
Soil Remediation  
430 28th Street  
Oakland, California

Dear Ms. Kasche:

This letter summarizes our observations and testing during remediation of lead contaminated soil at the referenced site. The location of the site is shown on the Site Plan, Plate 1.

Subsurface Consultants, Inc. (SCI) previously performed Geotechnical and Environmental Investigations at the site. Our investigations indicated that fill which had previously been stockpiled on the site by others, contained elevated concentrations of lead. Soluble lead concentrations resulted in the soil being characterized as a non-RCRA California Regulated Hazardous Waste. Since development plans require that the site be essentially graded to street level, the lead contaminated soils were remediated by removal and off-site disposal as detailed below.

#### Excavation and Disposal

The remediation involved excavating soils containing soluble lead concentrations in excess of 5 mg/l or total lead concentrations in excess of 50 mg/kg. The soils were stockpiled, loaded to trucks and transported under hazardous waste manifest to Gibson Environmental in Bakersfield, California. Each truck load was weighed as it entered the Gibson facility. Copies of the weight tickets and manifests are to be provided by the contractor under separate cover.

#### Confirmation Soil Sampling and Analysis

Initially, approximately 600 tons of fill were removed. SCI obtained confirmation samples of the soils left in-place. The

SCI 615.006  
Page 2

confirmation samples were obtained on a horizontal grid at 25 foot spacings as shown on Plate 1. All confirmation samples are labeled with the prefix "C". Soil samples were retained in clean brass liners, sealed with tape and refrigerated on-site. Soil samples remained refrigerated until delivery to the analytical laboratory. Chain-of-Custody documents accompanied the samples to the laboratory.

The soil samples were transmitted to Curtis & Tompkins, Ltd. an analytical laboratory certified by the State of California Department of Health Services. Sixteen confirmation samples were analyzed for soluble lead, EPA 7421 using the Waste Extraction Test (WET) Leachate. Additionally, in order to provide a general screening, two confirmation samples were analyzed for the following:

1. Title 26 Metals, EPA 6000 and 7000 series,
2. Volatile organic chemicals, EPA 8240, and
3. Total recoverable petroleum hydrocarbons (TRPH), EPA 418.1.

The analytical test results indicated that it was necessary to remove additional soil. Additional soil was removed and supplemental confirmation samples were obtained in these areas. Supplemental confirmation samples are labelled with the ending "- 2". The second round of confirmation samples were analyzed for Total lead, EPA 7421. One sample was also analyzed for TRPH. Summaries of the results of the confirmation tests are presented in Tables 1 and 2. Copies of analytical test reports are attached.

### Conclusions

The analytical test results confirm that soils containing lead above California hazardous waste levels were removed and transported under manifest to the Gibson facility. Lead concentrations in the soil remaining are below regulatory levels. The Title 26 metal analyses did not detect other heavy metals at concentrations of regulatory concern.

Volatile organics and recoverable petroleum hydrocarbons were not detected in the two samples analyzed as a general screening of the soils left in-place.

Based on our observations and test results, it is our opinion that

Ms. Kathryn Kasche

soil remediation has been completed in accordance with the intent of our recommendations and with project plans and specifications. If you have any questions, please call.

Yours very truly,

Subsurface Consultants, Inc.
