INTRODUCTION

The following report documents the semi-annual third quarter 2000 monitoring event conducted at the Hard Chrome Engineering facility, located 750 107th Avenue, Oakland, California (see Figure 1). The site currently operates as a chrome plating facility and occupies approximately 27,500 square feet. Groundwater monitoring consists of collecting groundwater samples for laboratory analyses from each monitoring well, measuring groundwater elevation in each monitoring well, and evaluating groundwater gradient and direction of groundwater flow beneath the site.

Background

Based on the Preliminary Environmental Characterization, BSK & Associates, September 29, 1992, and Summary and Evaluation of Environmental Conditions, Soil and Groundwater Investigation, March 24, 1998, EMCON, and Recommendations for Future Actions, Levine Fricke, July 2, 1996, it appears that groundwater and, to a lesser extent, soil beneath the site is impacted with chromium. As part of the previous investigations, soil borings SB-1 through SB-17 were drilled, and groundwater monitoring wells MW-1 and MW-1B through MW-6 were installed at the site. Site soil and groundwater impacted with chromium appears to be primarily located near a concrete-lined pit within the Hard Chrome facility (see Figure 2).

792775

SAMPLING AND ANALYSIS PROGRAM

IT/EMCON measured groundwater levels in each well on site using an electronic sounding device and reported the data on the monitoring well data forms included in Appendix A. Groundwater monitoring wells MW-1 through MW-6 and MW-1B were sampled consistent with the protocol presented in Figure 3 and submitted for chemical analysis. Groundwater samples collected on June 26 and 27, 1997, were not field filtered. Groundwater samples collected on September 20, 2000 were filtered in the field.

Groundwater samples collected from wells MW-1 through MW-6 and MW-1B were submitted to Sequoia Analytical (a state-certified laboratory) and analyzed for the CAM 17 listed dissolved metals using USEPA Series Methods 6000/7000 and for dissolved hexavalent chromium using USEPA Method 7196, and for dissolved mercury by USEPA Method 7470. See Appendix B for certified analytical results and chain-of-custody reports.

792775

RESULTS

Groundwater Flow and Gradient

Groundwater during the third quarter 2000 monitoring event was measured, and groundwater elevations were calculated in each well and used to construct a groundwater contour map (see Figure 4). During the third quarter 2000 monitoring event, groundwater flowed to the northwest with a gradient of approximately 0.033 foot per foot. These flow conditions are generally similar to those reported by the previous consultant and generally agree with assumed regional flow patterns.

Quality Control Results

Laboratory Quality Control (QC) data were evaluated to assess the acceptability of the analytical data, and therefore their usefulness in interpreting groundwater quality. Laboratory QC results are included with the analytical reports in Appendix B. The QC evaluation is summarized below.

- All analyses were performed within USEPA – recommended holding times
- The results of the daily laboratory method blanks were acceptable
- Matrix spike and matrix spike duplicates (MS/MSD) were performed by the laboratory. MS and MSD recoveries, and the relative percent difference (RPD) between duplicate results, were within acceptance limits.
- The laboratory reported the results of laboratory control samples (LCS). Results were within acceptance limits.
- Routine reporting limits were used to quantify and report the analytical results.

The laboratory QC results indicate that the groundwater analytical data are of acceptable quality and can be used to evaluate groundwater quality.

Groundwater Analytical Results

Concentrations of antimony detected in MW-1B and MW-2 ranged from 0.56 milligrams per liter (mg/L) and 2.67 mg/L. Concentrations of barium detected in MW-1, MW-3, MW-4, and MW-6 ranged from 0.0553 mg/L to 0.105 mg/L. Chromium detected in MW-1B, MW-2, MW-3, MW-5, and MW-6, ranged from 0.00665 mg/L to 598 mg/L. Hexavalent chromium detected in MW-1B, MW-2, and MW-5 ranged from 81.4 mg/L to 611 mg/L. Zinc detected in MW-2 and MW-6 ranged from 0.0133 mg/L to 1.12 mg/L. Copper, mercury, and nickel were detected in MW-2 at concentrations of 7.06 mg/L, 0.00078 mg/L, and 1.04 mg/L, respectively. Table 2 summarizes the groundwater analytical results.

792775

SUMMARY AND CONCLUSIONS

Based on analytical results collected from wells MW-1B and MW-1 through MW-6 on September 20, 2000 groundwater beneath the site is impacted with total and hexavalent chromium. Additional metals detected include antimony, barium, copper, mercury, nickel and zinc. Impacted water extends from the existing sump (well MW-2), northwest (hydraulically downgradient) towards the locations of wells MW-5 and MW-1B. The lateral extent of impacted groundwater beneath the site appears to be defined to the north by monitoring well MW-4; and to the south and southwest by wells MW-1, MW-3, and MW-6. The lateral extent of impacted groundwater has not been defined to the east or northwest of the site; however, concentrations of total chromium and hexavalent chromium have generally decreased in well MW-2 and wells MW-5 and MW-1B. Vertically, the extent of impacted groundwater has not been defined.

During the September 2000 monitoring event, the monitoring well exhibiting the greatest chromium impact was well MW-2, located hydraulically downgradient from the sump. Monitoring wells MW-5 and MW-1B also showed some chromium impact.

Although, concentrations of total chromium in on-site wells MW-1B, MW-2, and MW-5 currently exceed the maximum contaminant level (MCL) for this compound (.05 mg/L), they have significantly decreased from historical levels. Historical analytical results are contained in Table 2.

LIMITATIONS

The services described in this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, nor the use of segregated portions of this report.

RE: Hard Chrome Engineering/S009280

Dear Charles Metzinger

Enclosed are the results of analyses for sample(s) received by the laboratory on September 20, 2000. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Sandra R. Hanson
Client Services Representative
