Subject: Groundwater Quality Assessment
223 E. 14th Street, San Leandro, California

Dear Mr. Reynoso and Ms. Vallejo:

Aquifer Sciences is pleased to present this report containing the results of the groundwater quality assessment conducted for the property located at 223 E. 14th Street in San Leandro, California. We appreciate the opportunity to be of service. If you have any questions regarding this report, please call us.

Respectfully yours,

Justin K. Evans
Senior Staff Hydrogeologist

GROUNDWATER QUALITY ASSESSMENT

223 E. 14th Street, San Leandro, California
February 2016

1.0 INTRODUCTION

This report presents the results of the groundwater quality assessment conducted for the site (the “Site”) located at 223 E. 14th Street, San Leandro, California (Figure 1). The objective of this assessment was to collect and analyze groundwater samples from the existing four monitoring wells to evaluate groundwater quality at the Site. Groundwater sampling and analysis were performed in accordance with our work plan dated January 25, 2016.

2.0 SITE DESCRIPTION

The Site consists of 0.22 acre of land and is located at 223 E. 14th Street in San Leandro, California (Figures 1 and 2). Two one-story buildings are currently situated on the Site. The area surrounding the buildings includes landscaping and an asphalt-paved parking lot. During sample collection, the Site was occupied by San Gaspar Restaurant (201 E. 14th Street) and Sunshine Cleaners (223 E. 14th Street). The property is currently zoned as a mixed-use development including multi-story residential, commercial retail, and service-oriented use. The area surrounding the Site includes a dental office (Select Dental) to the north, and multi-story residences and apartments to the east, south, and west.

3.0 ENVIRONMENTAL HISTORY OF THE SITE

The Site has housed a drycleaning operation for approximately 40 years. Prior to 1993, a sewer line leading to the drycleaner building broke and was repaired. In December 1993, a subsurface environmental investigation was performed by ACC Environmental Consultants to evaluate whether chemicals used in drycleaning operations had contaminated the Site. Soil samples collected in the vicinity of the sewer line break indicated detectable levels of tetrachloroethene (PCE) and trichloroethene (TCE) to a depth of 10 feet in four borings. PCE was detected up to 4.2 mg/kg at a depth of 10 feet. TCE was detected up to 0.37 mg/kg at a depth 10 feet. In 1999, Earth Engineers installed four monitoring wells at the Site. Monitoring well construction details or groundwater sampling results were not found in the public records.

4.0 GROUNDWATER SAMPLING AND ANALYSIS

On February 1, 2016, groundwater samples were collected from four monitoring wells (MW-1 through MW-4) at the Site, as shown on Figure 2. The monitoring wells included one deep well (MW-4) drilled to a depth of approximately 50 feet and three shallow wells (MW-1, MW-2, and MW-3) drilled to a depth of approximately 35 feet. Prior to sampling, the depth to groundwater was measured in each well to the nearest 0.01 foot, using an electrical water level recorder. Depth to groundwater was measured between 23.15 and 23.85 feet below the tops of the well casings. Well descriptions, purging and sampling methods, and water quality

parameters (pH, temperature, specific conductance, salinity, and turbidity) were measured and recorded in the groundwater sampling logs. Copies of the groundwater sampling logs are included in Appendix A.

Samples were collected in clean bottles supplied by the analytical laboratory. The bottles were sealed, labeled, stored on ice in a cooler at 4° Celsius, and transported under chain-of-custody protocol within 24 hours of collection to McCampbell Analytical, a state certified analytical laboratory, located in Pittsburg, California.

All four groundwater samples were analyzed for volatile organic compounds (VOCs) and fuel oxygenates by EPA Method 8260B.

5.0 ANALYTICAL DATA EVALUATION

The results of laboratory analysis performed on the groundwater samples collected in February 2016 are presented in Table 1. A copy of the laboratory analytical report and chain-of-custody documentation are included in Appendix B.

The analytical data were compared to regulatory standards to evaluate the groundwater quality. The currently applicable regulatory guidelines are given by the Regional Water Quality Control Board (RWQCB) and consist of the Tier 1 environmental screening levels (ESLs) for groundwater (Summary Table A). The data was also compared to Table E-1 Groundwater Screening Levels for Evaluation of Potential Vapor Intrusion.

Table 1 summarizes the analytical data for VOCs in the groundwater samples. PCE was detected in the samples from wells MW-1, MW-2, MW-3, and MW-4 at concentrations of 54, 0.62, 0.69, and 1.0 $\mu\text{g}/\text{L}$, respectively. The ESL for PCE is 5 $\mu\text{g}/\text{L}$. Chloroform was also detected in the samples from wells MW-2 and MW-3 at concentrations of 3.0 and 4.7 $\mu\text{g}/\text{L}$, respectively. The ESL for chloroform is 80 $\mu\text{g}/\text{L}$. No other VOCs were detected in any of the groundwater samples.

6.0 SUMMARY AND CONCLUSIONS

In February 2016, Aquifer Sciences performed a groundwater quality assessment for the Site located at 223 E. 14th Street in San Leandro, California. The main objective of this assessment was to collect and analyze groundwater samples from the existing four monitoring wells to evaluate groundwater quality at the Site.

Groundwater samples were collected from four monitoring wells at the Site. Based on the results of the assessment, the following conclusions can be made:

- Groundwater beneath the Site was measured at depths between 23.15 to 23.85 feet below the tops of the well casings. The depth to groundwater in the deep well was similar to the shallow wells.
- The groundwater samples were analyzed for VOCs. PCE was detected above the ESL in the sample from well MW-1 at a concentration of 54 $\mu\text{g}/\text{L}$. PCE was detected in the

samples from wells MW-2, MW-3, and MW-4 at concentrations ranging from 0.62 to 1.0 $\mu\text{g/L}$.

- Chloroform was detected in the samples from wells MW-2 and MW-3 at concentrations of 3.0 and 4.7 $\mu\text{g/L}$, respectively. The detections of chloroform may originate from a leaking water supply line. Chloroform is often present in drinking water as a residual effect of the chlorination process.
- No other VOCs were detected above the laboratory reporting limits.
- The presence of PCE in the deep well (MW-4) indicates that there may be communication between the first and second water-bearing zones.

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).
- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.
