Subject: Off-site Groundwater Investigation Report  
Former Oil Recycling Site  
4200 Alameda Avenue, Oakland, California  
(EKI 930040.02)

Dear Mr. Chan:

Erler & Kalinowski, Inc. ("EKI") is pleased to submit the enclosed *Off-site Groundwater Investigation Report* for the former oil recycling site located at 4200 Alameda Avenue, Oakland California. This report summarizes the findings of the Off-site Groundwater Investigation conducted in February 1996.

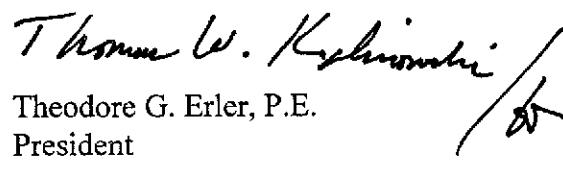

Please call if you have questions.

Very truly yours,

ERLER & KALINOWSKI, INC.

## **1.0 EXECUTIVE SUMMARY**

In February 1996, Erler & Kalinowski, Inc. ("EKI") conducted an Off-site Groundwater Investigation to assess whether there has been any significant off-site migration of chemicals in groundwater from the 4200 Alameda Avenue property ("the site"). The Investigation was performed in accordance with comments provided by Alameda County Department of Environmental Health in its letter, dated 29 September 1995, and subsequent discussions with the agency. Chemicals from more than 50 years of oil recycling operations had been detected in soil and groundwater on the site, but the Investigation indicated that there has been no significant migration of chemicals off-site.

The Investigation indicated no vertical migration of chemicals below the upper water-bearing unit (which is encountered at depth of about 10 feet below ground surface). In the upper water bearing-unit, there was no appreciable migration of benzene, toluene, ethylbenzene, total xylenes ("BTEX"), volatile organic compounds ("VOCs"), or arsenic, and only minimal migration of petroleum hydrocarbons. These petroleum hydrocarbons are predominantly high molecular weight (with carbon chain lengths between C<sub>16</sub> and C<sub>36</sub>) and thus tend to be immobile in groundwater. With the exceptions of the samples closest to the site (within 50 feet), petroleum hydrocarbons were either not detected or were not characteristic of fuel hydrocarbons associated with the site.

Thus, there is no appreciable lateral or vertical migration of BTEX, VOCs, or arsenic in groundwater from the site. Petroleum hydrocarbons were detected only in the upper water-bearing unit a short distance from the site, and those detected hydrocarbons tend to be immobile because of their high molecular weight. Therefore, additional off-site investigation is not warranted.

## **2.0 SITE DESCRIPTION**

The site is located at 4200 Alameda Avenue in Oakland, California. The site was developed as an oil recycling facility and oil recycling took place on the site from approximately 1925 to 1981. It has been known by various names including "Bonus International, Inc.", "Bayside Oil Company", "Fabian Oil Refining Company", "Economy Refining & Service Company", "Economy Byproducts & Economy Service Company", and "Ekotek Lube, Inc." No activities have occurred on the site since oil recycling was discontinued. Waste oil received by the facility primarily consisted of oils from automobiles, railroad locomotives, aircraft, and electrical transformers. Stoddard solvent was also reportedly recycled at the facility until approximately 1978.

### **3.0 SUMMARY OF PREVIOUS ON-SITE INVESTIGATION**

At the request of the Alameda County Department of Environmental Health ("ACDEH") and the Regional Water Quality Control Board, San Francisco Bay Region ("RWQCB"), Erler & Kalinowski, Inc. ("EKI") performed a Preliminary Investigation of the former oil recycling facility located at 4200 Alameda Avenue. The Preliminary Investigation was performed in July 1995 and entailed drilling 10 soil borings and subsequently constructing groundwater monitoring wells in 5 of these borings. EKI collected and analyzed soil and grab groundwater samples from borings and groundwater samples from wells. Selected soil and groundwater samples were analyzed for the following:

- Total petroleum hydrocarbons ("TPH")
- Benzene, toluene, ethylbenzene, total xylenes ("BTEX")
- Halogenated volatile organic compounds ("VOCs")
- Semivolatile organic compounds ("SVOCs")
- Polychlorinated biphenyls ("PCBs")
- Selected metals (arsenic, total chromium, and lead)

The objectives of the Preliminary Investigation were to characterize the nature of chemicals in on-site soil and groundwater and to assess the direction of groundwater flow across the site.

On-site soil and groundwater sampling results are discussed in detail in EKI's report, dated 14 September 1995, entitled *Preliminary Investigation Report, Former Oil Recycling Site, 4200 Alameda Avenue, Oakland, California*. The Preliminary Investigation found petroleum hydrocarbons in soil and groundwater on the site. SVOCs were not detected in soil and BTEX and halogenated VOCs were detected only at low concentrations. PCBs and arsenic, total chromium, and lead were also detected only at low concentrations. Detected concentrations of BTEX and halogenated VOCs were found to be associated with petroleum hydrocarbons in groundwater. Groundwater elevations in on-site wells indicate that bulk groundwater movement on the site is to the south in the direction of San Leandro Bay.

## **4.0 SUMMARY OF OFF-SITE GROUNDWATER INVESTIGATION**

The Off-site Groundwater Investigation entailed performing six cone penetrometer tests ("CPTs") and subsequently collecting grab groundwater samples through the use of "Push In" PVC Piezometers ("PIPP"). EKI also collected and analyzed a soil sample from the three CPT locations closest to the site. Soil and groundwater samples were analyzed for petroleum hydrocarbons, BTEX, halogenated VOCs, and arsenic.

### **4.1 Objective of Off-site Groundwater Investigation**

On the basis of soil and groundwater analytical data obtained on the 4200 Alameda Avenue property, additional sampling activities were recommended to assess whether any chemical migration in groundwater from the site has occurred. EKI presented the scope of an Off-site Groundwater Investigation intended to accomplish this objective in its *Preliminary Investigation Report*, dated 14 September 1995.

ACDEH, acting as lead agency, provided comments on the scope of the Off-site Groundwater Investigation in its letter, dated 29 September 1995. EKI modified the scope of work based on these comments and subsequent telephone discussions with ACDEH. Mr. Barney Chan, of ACDEH, orally approved the scope of the Off-site Groundwater Investigation during a telephone conversation on 13 February 1996.

### **4.2 Off-site Groundwater Investigation Field Activities**

Field activities were conducted from 15 to 17 February 1996. Under EKI supervision, EARTH TECH, Inc. ("EARTH TECH") performed CPT logging and PIPP groundwater sampling at six off-site locations (i.e., CPT-1, CPT-3, CPT-4, CPT-5, CPT-6, and CPT-7) as shown on Figure 1. All CPT/PIPP sampling locations were along the right-of-ways or in the City of Oakland streets. Before conducting sampling activities, EKI obtained a drilling permit from the Alameda County Flood Control and Water Conservation District and excavation permits from the City of Oakland, Office of Planning and Building.

EKI had planned to sample at a seventh location besides the six locations where CPT/PIPP sampling was performed. This seventh location (i.e., CPT-2) was proposed in High Street. However, the possible presence of an underground oil pipeline was identified when this location was inspected for abandoned or otherwise unmarked below ground obstructions. The possible presence of the pipeline meant that hand excavation was required before CPT/PIPP sampling could have been conducted. Due to the added time to hand excavate, CPT/PIPP sampling in High Street was not feasible because CPT/PIPP sampling could not be conducted within the two hour period specified in the City of Oakland excavation permit for CPT-2.

#### 4.2.1 Cone Penetrometer Test and "Push In" PVC Piezometer Sampling Procedures

CPT/PIPP sampling was accomplished by pushing the CPT, soil, and PIPP sampling probes into the ground. EARTH TECH pushed the probes by means of hydraulic rams mounted in a 23-ton rig. Each CPT was completed to an approximate depth of 50 feet, bgs. CPT measurements consisted of the penetration resistance experienced by a pressure sensitive probe as it was pushed into the ground at a test location. EARTH TECH used these measurements to determine subsurface lithology. Upon completing CPT measurements, the probe was removed and the resulting hole was abandoned as discussed in Section 4.2.2. A separate hole was used to collect soil and PIPP groundwater samples at each test location. Logs of CPTs are presented as Appendix A.

At CPT-1, CPT-3, and CPT-4, a soil sample was obtained from the capillary fringe of the shallow water-bearing unit encountered in each of these probe holes. EARTH TECH collected soil samples in stainless steel liners by pushing and retrieving a sampling probe attached to steel rods. The ends of the stainless steel liners were covered with Teflon sheets and plastic end caps upon collection. Soil samples were refrigerated and delivered under chain-of-custody procedure to Sequoia Analytical Laboratory in Redwood City, California for testing as discussed in Section 4.2.3.

Where possible, two PIPP groundwater samples were collected at each test location. The first PIPP sample was collected from the shallow water-bearing unit encountered between approximately 10 to 15 feet, bgs. The second PIPP sample was collected from the top of the next deeper permeable unit encountered between approximately 30 to 40 feet, bgs. The PIPP sampling probe consists of two main components; an outer protective casing and an inner slotted PVC screen section that is 5 feet in length. Once the PIPP sampling probe is advanced to the desired depth, the outer casing is raised and the slotted section is exposed to formation groundwater. EARTH TECH used a clean 3/4-inch diameter Teflon bailer to collect groundwater samples from each sampling depth at each test location. Upon completing groundwater sampling, the probe was removed and the resulting hole was abandoned as discussed in Section 4.2.2.

Groundwater samples were collected in containers as specified by the appropriate EPA method. Groundwater samples were refrigerated and delivered under chain-of-custody procedure to Sequoia Analytical Laboratory for testing as discussed in Section 4.2.3.

#### 4.2.2 Abandonment of CPT and PIPP Probe Holes

EARTH TECH grouted the open probe hole upon completing each CPT and PIPP sampling attempt. This was accomplished by grouting each hole with a bentonite/cement mixture. A tremie pipe was placed to the bottom of each hole. Grout was pumped down the pipe and the pipe was withdrawn, allowing grout to backfill and seal the hole from the

bottom of the hole to just below ground surface. Ready-mix concrete was used to complete abandonment of each CPT and PIPP hole.

#### 4.2.3 Analysis of Soil and PIPP Groundwater Samples

Soil and grab groundwater samples collected as part of the Off-site Groundwater Investigations were analyzed for the following:

- Total purgeable petroleum hydrocarbons (as gasoline) by EPA Method 8015m
- Total extractable petroleum hydrocarbons (as diesel) by EPA Method 8015m
- Fuel fingerprint (as motor oil) by EPA Method 8015m
- BTEX by EPA Method 8020
- Halogenated VOCs by EPA Method 8010
- Arsenic by EPA Method 7060

Copies of analytical testing reports are included as Appendix B.

#### 4.2.4 Land Survey Activities

MacLeod and Associates, Inc., a licensed land surveyor, surveyed CPT/PIPP locations. Locations were surveyed to establish elevations and horizontal locations relative to a site monument. Survey data were used to prepare figures and cross-sections.

## 5.0 PHYSICAL CHARACTERISTICS OF THE SITE

Summarized in this section are the physical setting, geology, and hydrogeology of the site compiled from the Preliminary Investigation and the Off-site Groundwater Investigation.

### 5.1 Surface Features

The site is a small, triangular-shaped property that encompasses less than 35,000 ft<sup>2</sup> or 0.8 acres. The site is bounded by Alameda Avenue along its western side, East 8th Street along its east-southeastern side, and the former American National Can Company ("ANCC") site along its northern side.

The site is essentially flat. The elevation change across the entire site is less than 2 feet or 1 percent. Until recently, the site contained three small buildings, numerous above ground tanks and other process equipment that was used historically in oil recycling operations. Demolition of the majority of the above ground tanks was completed in November 1995. Demolition of the remaining above grade structures and removal of underground tanks and appurtenances (e.g., pipelines, sumps, catch basins, utilities) was initiated in March 1996. Upon completing demolition and excavation activities, the site will be graded and covered with asphalt pavement. The asphalt pavement will be sloped to drain to gutters located along Alameda Avenue and East 8th Street.

### 5.2 Geology and Hydrogeology

Soils immediately underlying pavement on- and off-site consist of artificial fill extending to approximately 1.5 to 4 feet below ground surface ("bgs"). This artificial fill overlays a silty clay that extends to a depth of 6 to 15 feet, bgs. Contained within this silty clay are 1 to 2 foot thick discontinuous lenses of clayey gravel and silty sand.

Located beneath the silty clay is the first water-bearing unit. This first water-bearing unit ranges in thickness from approximately 1 to 5 feet and consists of clayey sands, sandy gravel, gravelly sand, and sandy gravel. Below this first water-bearing unit are clays and silty clays that extend to the maximum depth explored (i.e., 50 feet, bgs). Interbedded in these clays and silts are thin discontinuous sand lenses. The thickest of these discontinuous sand lenses was encountered between 38 and 40 feet, bgs in the vicinity of CPT-1 and CPT-3. The sand lens encountered in this area is 1 to 1.5 feet thick. These discontinuous sand lenses are referred to as the next deeper permeable unit in this report. Presented on Figures 2 and 3, respectively, are a west to east cross section (A-A') and a north to south (B-B') cross-section. These cross-sections were compiled from lithologic logs of borings completed on the site and logs obtained from CPTs performed off-site. Cross-section locations are shown on Figure 1.

## 6.0 NATURE AND EXTENT OF CHEMICAL OCCURRENCE

Summarized in this section are the nature and extent of chemicals found in soil and groundwater off the site.

### 6.1 Chemicals in Soil

Summarized in Table 1 and shown on Figure 4 are TPH analytical results of soil samples collected as part of the Off-site Groundwater Investigation. Soil samples were also analyzed for BTEX, halogenated VOCs, and arsenic. Analytical results for these compounds are summarized in Tables 2 through 4 and shown on Figures 4 and 5.

#### 6.1.1 Petroleum Hydrocarbons in Soil

Soil samples were collected from the three CPT locations closest to the site. TPH was detected in samples obtained from CPT-1 and CPT-3. No TPH was detected in the soil sample collected from CPT-4. These data are consistent with the groundwater sampling results for these locations. Petroleum hydrocarbons were detected in shallow groundwater samples collected from CPT-1 and CPT-3. No TPH characteristic of fuel hydrocarbons was detected in the shallow groundwater sample collected from CPT-4.

Soil samples were collected from the capillary fringe of the shallow water-bearing unit at all three locations. Consequently, petroleum hydrocarbons detected in samples collected from CPT-1 and CPT-3 most likely represent TPH in groundwater that has sorbed to saturated soils. As summarized in Table 1, petroleum hydrocarbons in soil were quantitated as TPH as gasoline (C<sub>7</sub> to C<sub>12</sub>), diesel (C<sub>9</sub> to C<sub>24</sub>), and motor oil (C<sub>16</sub> to C<sub>36</sub>). Gasoline fractions were detected only in CPT-1 at a concentration of 1,200 mg/kg. Diesel fractions were measured at 4,700 mg/kg in CPT-1 and 17 mg/kg in CPT-3. Motor oil fractions were measured at 5,100 mg/kg in CPT-1 and 54 mg/kg in CPT-3.

#### 6.1.2 BTEX and Halogenated VOCs in Soil

BTEX and halogenated VOCs were detected only in the soil sample collected from CPT-1 (Tables 2 and 3 and Figures 4 and 5). Ethylbenzene was detected at 2.4 mg/kg and total xylenes were detected at 18 mg/kg in the soil sample from CPT-1. The only halogenated VOC detected in this sample was 1,2-dichlorobenzene at 0.28 mg/kg. These chemicals are likely associated with TPH detected in soil at CPT-1.

### 6.1.3 Arsenic in Soil

As summarized in Table 4, arsenic was not measured above the analytical method limit of detection of 5 mg/kg in any of three soil samples obtained at off-site CPT locations.

## 6.2 Chemicals in Groundwater

Summarized in Table 5 and shown on Figure 6 are TPH analytical results of groundwater samples collected as part of the Off-site Groundwater Investigation. Groundwater samples were also analyzed for BTEX, halogenated VOCs and dissolved arsenic. Analytical results for these compounds are summarized in Tables 6 through 8 and shown on Figures 6 and 7.

### 6.2.1 Petroleum Hydrocarbons in Shallow Groundwater

The results of the Off-site Groundwater Investigation indicate that petroleum hydrocarbons representative of fuel hydrocarbons are present in the shallow water-bearing unit located a short distance from the site. This first water-bearing unit is located at a depth of approximately 10 feet, bgs. Fuel hydrocarbons were detected in shallow groundwater samples collected from CPT-1 and CPT-3. Petroleum hydrocarbons in groundwater were quantitated as TPH as gasoline (C<sub>7</sub> to C<sub>12</sub>), diesel (C<sub>9</sub> to C<sub>24</sub>), and motor oil (C<sub>16</sub> to C<sub>36</sub>). Gasoline fractions in shallow groundwater were measured at 2,100 ug/L in CPT-1 and 1,800 ug/L in CPT-3. Diesel fractions were measured at 83,000 ug/L in CPT-1 and 270,000 ug/L in CPT-3. Motor oil fractions were measured at 86,000 ug/L in CPT-1 and 350,000 ug/L in CPT-3. CPT-1 and CPT-3 are situated approximately 50 feet from the downgradient edge of the 4200 Alameda Avenue site boundary as shown on Figure 6.

Although approximately equivalent concentrations of TPH as diesel and motor oil were reported in groundwater samples collected from CPT-1 and CPT-3, review of the chromatograms for these samples (Appendix B) indicate that the TPH is predominantly high molecular weight with carbon chain lengths between C<sub>16</sub> and C<sub>36</sub>. Equal concentrations of TPH as diesel and TPH as motor oil result from the overlap in carbon chain lengths when quantitating these petroleum hydrocarbon fractions. The high molecular weight hydrocarbons detected at CPT-1 and CPT-3 are not likely to be mobile in groundwater due to their limited solubility in water.

Further, it is uncertain whether petroleum hydrocarbons in groundwater samples collected from CPT-1 and CPT-3 originate from the site. This TPH may be due entirely or in part to a release from another off-site source. Utilities drawings prepared by the City of Oakland show the location of a 10-inch diameter oil pipeline near the 4200 Alameda Avenue site. EKI confirmed the presence of this pipeline with Mr. N.J. Russo of the Shell Pipe Line Corporation. According to Mr. Russo, Shell Oil Company once owned

and operated this pipeline but has sold it to Simmons Oil Company. Mr. Russo stated that aviation fuel was conveyed in the pipeline when Shell owned it. EKI was unsuccessful in contacting Simmons Oil to determine if the pipeline is currently in use and, if so, what type of petroleum product is being carried in the pipeline. Mr. Russo provided drawings showing the alignment of the pipeline as of January 1969. EKI has plotted the pipeline on figures (e.g., Figure 6) in this report from drawings provided by Mr. Russo.

Other potential sources of petroleum hydrocarbons exist in the vicinity of the 4200 Alameda Avenue site. In February 1996, EKI reviewed available ACDEH files on hazardous materials release and use sites near 4200 Alameda Avenue. The following properties were identified from this review as sites that stored petroleum products and may have had releases to soil or groundwater:

- Former American National Can Company, 4000 Alameda Avenue
- J.M. Rich Paint and Varnish Company, 615 High Street
- Former United States Cold Storage, 3925 Alameda Avenue
- Shell Service Station, 630 High Street

The proximity of these sites to 4200 Alameda Avenue is shown on Figure 6.

Given the identified potential release sites and history of manufacturing that has taken place in the area, TPH detected in the shallow groundwater sample collected from CPT-5 may not originate from 4200 Alameda Avenue. No TPH representative of fuel hydrocarbons was detected in the shallow groundwater sample collected from CPT-4. As shown on Figure 6, CPT-4 is located upgradient of CPT-5 and close to 4200 Alameda Avenue.

According to the laboratory narrative (Appendix B) prepared by Sequoia Analytical, the quantitated TPH values for the shallow groundwater sample collected from CPT-4 are most likely due to some other type of organic matter in the water samples. Mr. Todd Olive, of Sequoia Analytical, indicated that the organic matter is likely to be naturally-occurring and stated that TPH results like that obtained for CPT-4 are not uncommon when sampling in a bay mud environment such as where the 4200 Alameda Avenue site is situated. The analytical method used to quantitate TPH is subject to matrix effects and the presence of interfering organics (State of California LUFT, 1989).

Consequently, PIPP groundwater sampling results indicate that the migration of petroleum hydrocarbons from the site is limited notwithstanding the existence of other potential TPH sources in the vicinity of the site. This finding of limited migration is further supported by groundwater monitoring data compiled for the Shell service station

located at 630 High Street (Figure 6). The Shell service station is located downgradient of 4200 Alameda Avenue. Analysis for TPH as motor oil has been conducted on three occasions for the monitoring wells located on the upgradient edge of the Shell site. These monitoring wells are identified as SSMW-5, SSMW-6, and SSMW-7 on Figure 6. On none of these occasions has TPH as motor oil been measured above the 500 ug/L analytical method limit of detection. TPH as gasoline and TPH as diesel have been measured as high as 14,000 ug/L and 7,100 ug/L, respectively, in wells SSMW-5, SSMW-6, and SSMW-7. However, Weiss Associates (1995) concludes that these petroleum hydrocarbon fractions are due to a fuel release that occurred on the Shell site. This conclusion is corroborated by the TPH results for groundwater samples collected from CPT-1 and CPT-3. Petroleum hydrocarbons detected in groundwater at these CPT locations consisted predominantly of motor oil fractions with relatively small amounts of TPH as gasoline and TPH as diesel.

#### 6.2.2 Petroleum Hydrocarbons in Deeper Groundwater

As shown on Figure 6, no TPH representative of fuel hydrocarbons was detected in any of the PIPP groundwater samples collected from the next deeper permeable unit encountered below the shallow water-bearing zone. The top of this next deeper permeable unit is located at a depth of approximately 30 to 40 feet, bgs and separated from shallow groundwater by 15 to 20 feet of clays and silty clays. Review of Sequoia Analytical laboratory narratives (Appendix B) indicates that TPH values reported for deeper PIPP groundwater samples are due to organic matter other than petroleum hydrocarbons. TPH analytical results do not show that downward vertical migration of petroleum hydrocarbons has taken place.

#### 6.2.3 BTEX and Halogenated VOCs in Shallow Groundwater

BTEX and certain halogenated VOCs were detected in PIPP groundwater samples collected from the shallow water-bearing zone (Tables 6 and 7; Figures 6 and 7). In general, these compounds were detected at concentrations below or near relevant State of California Maximum Contaminant Levels ("MCLs"). Halogenated VOCs detected include 1,2-dichloroethane ("1,2-DCA"), chlorobenzene, 1,2-dichlorobenzene ("1,2-DCB"), 1,3-dichlorobenzene ("1,3-DCB"), 1,4-dichlorobenzene ("1,4-DCB") 1,1-dichloroethane ("1,1-DCA"), tetrachloroethene ("PCE"), trichloroethene ("TCE"), cis-1,2-dichloroethene ("cis-1,2-DCE"), trans-1,2-dichloroethene ("trans-1,2-DCE"), and carbon tetrachloride. Review of analytical data do not indicate there has been any appreciable lateral migration of BTEX or VOCs in groundwater from the site.

#### 6.2.4 BTEX and Halogenated VOCs in Deeper Groundwater

BTEX and halogenated VOCs were detected only sporadically in PIPP groundwater samples collected from the next deeper permeable unit (Tables 6 and 7; Figures 6 and 7).

Total xylenes were detected at 8.7 ug/L in the deeper groundwater sample collected from CPT-1. In deeper groundwater samples collected from CPT-1, CPT-3, CPT-5, CPT-6, and CPT-7, 1,2-DCA was detected at concentrations ranging from 0.75 to 2.5 ug/L. No correlation exists between the concentration of 1,2-DCA detected and the distance from the site (Figure 7). Further, 1,2-DCA was not detected in any of the shallow groundwater samples collected as part of this investigation. PIPP groundwater sample analytical results do not indicate any appreciable vertical migration of BTEX or VOCs from the 4200 Alameda Avenue site. *JK*

#### 6.2.5 Dissolved Arsenic in Shallow Groundwater

PIPP groundwater samples were filtered in the laboratory before testing was conducted for arsenic. As summarized in Table 8, dissolved arsenic was detected in only the shallow groundwater sample collected from CPT-1. Dissolved arsenic was detected at 0.017 mg/L in this sample. The detected level of arsenic in this sample likely originates from arsenic that is naturally occurring in soil and/or groundwater at the site. Concentrations of TPH detected in groundwater suggest that anaerobic (i.e., absence of oxygen) subsurface conditions exist at location CPT-1. As reported by Masscheleyn et al. (1991), Aggett and Kriegman (1988), and Gulens et al. (1979), arsenic can be reduced to more soluble forms under anaerobic conditions. Arsenic does not appear to be of significant concern as it was not detected in any other PIPP groundwater samples collected as part of this investigation. *OK*

#### 6.2.6 Dissolved Arsenic in Deeper Groundwater

Dissolved arsenic was not detected in any of the PIPP groundwater samples collected from the next deeper permeable unit (Table 8).

## **7.0 CONCLUSIONS**

Conclusions obtained from the Off-site Groundwater Investigation regarding soil and groundwater conditions downgradient of the site are as follows:

### Soil:

- Petroleum hydrocarbons were detected in soil samples collected from the capillary fringe of the shallow water-bearing unit at CPT-1 and CPT-3, and most likely represent TPH in groundwater that has sorbed to saturated soils. (*could expect some in all down gradient areas.*)
- BTEX and halogenated VOCs were detected only in the soil sample collected from CPT-1. Ethylbenzene was detected at 2.4 mg/kg and total xylenes were detected at 18 mg/kg in the soil sample from CPT-1. The only halogenated VOC detected in this sample was 1,2-dichlorobenzene at 0.28 mg/kg. These chemicals are likely associated with TPH detected in soil at CPT-1. *Check source tox.*
- Arsenic was not detected above the analytical method limit of detection of 5 mg/kg in any of three soil samples obtained at off-site CPT locations.

### Groundwater:

- Petroleum hydrocarbons were detected in the shallow water-bearing unit at a distance of approximately 50 feet from the downgradient edge of the site. Review of chromatograms indicate that the TPH detected in off-site groundwater at this distance is predominantly high molecular weight with carbon chain lengths between C<sub>16</sub> and C<sub>36</sub>, and not likely to be mobile in groundwater due to their limited solubility in water. Further, it is uncertain whether these petroleum hydrocarbons originate from the site, since there are other potential sources. *— what about that which was reported as TPH g?*
- TPH representative of fuel hydrocarbons were not detected in any of the deeper groundwater samples collected as part of this investigation. Analytical data indicate that downward vertical migration of petroleum hydrocarbons has not occurred.
- BTEX and certain halogenated VOCs were detected in PIPP groundwater samples collected from the shallow water-bearing unit at concentrations generally below or near relevant State of California Maximum Contaminant Levels. The analytical data indicate there has not been any appreciable lateral migration of BTEX or VOCs in groundwater from the site.

- Dissolved arsenic was detected only in the shallow groundwater sample collected from CPT-1. Only 0.017 mg/L was detected in this sample, and arsenic was not detected in any other PIPP groundwater samples collected as part of this investigation.

No additional off-site investigations are proposed based on the above findings.

Notes:

(a) Less than symbol ("<") denotes that compound was not present above the detection limit shown.

(b) According to the laboratory narrative prepared by Sequoia Analytical, quantitated TPH value is most likely due to organic matter other than petroleum fuels.

The cone penetration tests described in this report were conducted in general accordance with the current ASTM specifications (ASTM D3441-94) using an electronic cone penetrometer.

The CPT equipment operated by EARTH TECH, Inc., consists of a cone assembly mounted at the end of a series of hollow sounding rods. A set of hydraulic rams is used to continuously push the cone and rods into the soil at a rate of 20-mm per second (approximately 4 feet per minute) while the cone tip resistance and sleeve friction resistance are recorded every 25-mm (approximately 1-inch) and stored in digital form. A specially designed all wheel drive 23-ton truck provides the required reaction weight for pushing the cone assembly and is also used to transport and house the test equipment.

The cone penetrometer assembly used for this project consists of a conical tip and a cylindrical friction sleeve. The conical tip has a 60° apex angle and a diameter of 35.6-mm (1.40-inch) resulting in a projected cross-sectional area of 10 cm<sup>2</sup> (1.5 square inches). The cylindrical friction sleeve is 133-mm (5.25-inch) in length and has an outside diameter of 35.8-mm (1.41-inch), resulting in a surface area of 150 cm<sup>2</sup> (23 square inches).

The interior of the cone penetrometer is instrumented with strain gauges that allow simultaneous measurement of cone tip and friction sleeve resistance during penetration. Continuous electric signals from the strain gauges are transmitted by a shielded cable in the sounding rods to the PC-based data acquisition hardware in the CPT truck. The sounding log is also displayed on a monitor.

The preliminary CPT data processing was performed using the truck mounted computer based data acquisition and presentation system. The computer generated plots delivered to you in the

Page 2

field include cone resistance, friction resistance, friction ratio (and optional pore pressure ratio) versus depth at a user selectable scale. The final plots and tables included with this letter have been examined for any anomalies such as spikes, and required corrections made.

Soil Behavior Type and other parameter interpretations are based on the following reference: Robertson, P.K. and Campanella, R.G., 1989 "Guidelines for Geotechnical Design using the Cone Penetrometer Test and CPT with Pore Pressure Measurement." Soil Mechanics series No. 120, Civil Engineering Department, University of British Columbia, Vancouver, B.C., V6T 1Z4, September 1989.

Soil Behavior Type interpretations are based on the following reference:

Douglas, B.J. and R.S. Olsen (1981), "Soil Classification Using Electronic Penetrometer, "Proceedings, Cone Penetration Testing Experience, Session Sponsored by the Geotechnical Engineering Division, ASCE National Convention, St. Louis, October, pp. 209-227.

Some care is recommended when using the Soil Behavior Type tabulations. If a tabulation depth happens to fall on a soil layer interface, or a seam of soil differing from the rest of the layer, the tabulated data can be misleading. The solution to this problem is the proper use of the CPT logs. The continuous penetration resistance is the primary source of profile description; the Soil Behavior Type tabulations are supplemental. The continuous logs should be examined and layer boundaries delineated in accordance with the project requirements. The Soil Behavior Type tabulations are only representative of the response of the soil to the large shear deformations imposed during cone penetration. This is not necessarily a prediction of grain size distribution. However, it has been found that Soil Behavior Types generally agree well with the soil types defined in accordance with the grain size distribution methods such as used in the Unified Soil Classification System.

Computer generated cone penetration test plots and the results of cone penetrometer test data are included at Attachment A to this letter report.

#### **Limitations**

EARTH TECH presents the attached data in accordance with ASTM Standard D3441-86 and generally accepted Cone Penetration Test practices and standards.

The attached data further relates only to the specific project location discussed in the data.

Judgement may be required to verify the CPT Soil Behavior Interpretations and other estimated parameter values.

## LABORATORY NARRATIVE

8010 Note: Samples CPT-1-10S and CPT-1-11W were diluted due to high non-target analytes, therefore, the detection limits were raised.

TEPH Note: Q= The surrogates were diluted out of samples CPT-1-10S and CPT-1-11W.

The total extractable petroleum hydrocarbon and fuel fingerprint chromatogram patterns for samples CPT1-34W and CPT7-43W do not resemble a petroleum product. The quantitated values are most likely due to some other type of organic matter in the water samples.

**Please Note:**

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

**Please Note:**

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

|---------------------------------|--------|--------|--------|
| MS/MSD<br>LCS<br>Control Limits | 30-140 | 40-130 | 40-130 |
|---------------------------------|--------|--------|--------|

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

\*\* MS = Matrix Spike, MSD = MS Duplicate, RPD = Relative % Difference

## LABORATORY NARRATIVE

**TEPH Note:** The total extractable petroleum hydrocarbon and fuel fingerprint chromatogram patterns for samples CPT5-33W and CPT4-12W do not resemble a petroleum product. The quantitated values are most likely due to some other type of organic matter in the water samples.

### Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

SEQUOIA ANALYTICAL

Todd Olive  
Project Manager

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

| <b>MS/MSD<br/>LCS<br/>Control Limits</b> | 30-140 | 40-130 | 40-130 |
|--|--------|--------|--------|

**Please Note:**

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

Operator : JM

Instrument : GCHP\_04

Channel : A A/D mV Range : 1000

AutoSampler : HP7673A

Rack/Vial : 0/76

Interface Serial # : NONE Data Acquisition Time: 2/25/96 02:03

Delay Time : 0.00 min.

End Time : 33.65 min.

Sampling Rate : 1.2500 pts/sec

Raw Data File : S:\GHP\_04\0225\224A026.RAW

Result File : S:\GHP\_04\0225\224A026.RST

Inst Method : S:\GHP\_04\MET\_SEQ\TPH04A from S:\GHP\_04\0225\224A026.RST

Proc Method : S:\GHP\_04\MET\_SEQ\TPH04A

Calib Method : S:\GHP\_04\MET\_SEQ\TPH04A

Sequence File : S:\GHP\_04\MET\_SEQ\H040224.SEQ

Sample Volume : 1.0000 uL Area Reject : 0.000000

Sample Amount : 1.0000 Dilution Factor : 1.00

## LABORATORY NARRATIVE

TEPH Note: Q= Surrogate diluted out for sample CPT3-11W.  
Q= Surrogate coeluted with sample matrix for sample CPT3-10S.  
The total extractable petroleum hydrocarbon and fuel fingerprint chromatogram patterns for samples CPT6-11, CPT6-28, and CPT3-37W do not resemble a petroleum product. The quantitated values are most likely due to some other type of organic matter in the water samples.

Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

SEQUOIA ANALYTICAL  
  
Todd Olive  
Project Manager

Please Note:  
The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

\*\* MS = Matrix Spike, MSD = MS Duplicate, RPD = Relative % Difference

| MS/MSD<br>LCS<br>Control Limits | 30-140 | 40-130 | 40-130 |
|---------------------------------|--------|--------|--------|

### Please Note:

The LCS is a control sample of known, interferent-free matrix that is analyzed using the same reagents, preparation, and analytical methods employed for the samples. The matrix spike is an aliquot of sample fortified with known quantities of specific compounds and subjected to the entire analytical procedure. If the recovery of analytes from the matrix spike does not fall within specified control limits due to matrix interference, the LCS recovery is to be used to validate the batch.

\*\* MS = Matrix Spike, MSD = MS Duplicate, RPD = Relative % Difference

Report stored in ASCII file: S:\GHP\_04\0303\226A024.TX1

Sample Name : 9602E84-03A  
FileName : S:\GHP\_01\0303\226B010.raw  
Method : TPH  
Start Time : 0.00 min End Time : 29.99 min  
Scale Factor: -1.0 Plot Offset: 15 mV

Sample #: CPT6-28W Page 1 of 1  
Date : 2/26/96 14:37  
Time of Injection: 2/26/96 14:07  
Low Point : 15.28 mV High Point : 135.28 mV  
Plot Scale: 120.0 mV

Software Version: 4.0&lt;3H19&gt;

Time : 2/26/96 14:37

Sample Name : 9602E84-03A

Study : EKI

Sample Number: CPT6-28W

Operator :

Instrument : GCHP\_01

Channel : B A/D mV Range : 1024

AutoSampler : NONE

Rack/Vial : -28927/1

Interface Serial # : NONE Data Acquisition Time: 2/26/96 14:07

Delay Time : 0.00 min.

End Time : 29.99 min.

Sampling Rate : 1.2500 pts/sec

Raw Data File : S:\GHP\_01\0303\226B010.RAW

Result File : S:\GHP\_01\0303\226B010.RST

| MTBE         | 2.123                                 |
| Ethylbenzene | 10.916                                |

Report stored in ASCII file: S:\GHP\_01\0303\226B012.TX0

- Software Version: 4.0<3H19>

Time : 2/26/96 16:06

Sample Name : 9602E84-06A

Study : EKI

Sample Number: CPT3-37W

Operator :

Instrument : GCHP\_01

Channel : B A/D mV Range : 1024

NoSampler : NONE

Rack/Vial : -28927/1

Interface Serial # : NONE Data Acquisition Time: 2/26/96 15:35

Delay Time : 0.00 min.

End Time : 29.99 min.

Sampling Rate : 1.2500 pts/sec

Raw Data File : S:\GHP\_01\0303\226B012.RAW

Result File : S:\GHP\_01\0303\226B012.RST

Inst Method : S:\GHP\_01\MET\_SEQ\TPH from S:\GHP\_01\0303\226B012.RST

Proc Method : S:\GHP\_01\MET\_SEQ\btx

Calib Method : S:\GHP\_01\MET\_SEQ\btx

Sequence File : S:\GHP\_01\MET\_SEQ\H010226.SEQ

Sample Volume : 1.0000 Area Reject : 300.000000

Sample Amount : 1.0000 Dilution Factor : 1.00
