909 Bluebell Drive, Livermore, CA

Dear Mr. Wickham:

Enclosed, please find a copy of the October 1, 2007 subject Drilling and Monitoring Well Installation prepared by my consultant, Enviro Soil Tech Consultants.

I declare, under penalty of perjury, that the information and/or recommendations contained in this report are true and correct to the best of my knowledge.

Sincerely,

MASOOD AMINI

**SUBJECT: DRILLING AND MONITOR WELL INSTALLATION
AT THE PROPERTY**

Located at 909 Bluebell Drive, in
Livermore, California

Dear Mr. Filabadi:

Enviro Soil Tech Consultants (ESTC) submitted a work plan in May 2007 to the Alameda County Health Care Services Agency on your behalf to continue the investigation of groundwater contamination beneath your property located at 909 Bluebell Drive in Livermore. The second and fourth tasks that were proposed in that plan were to drill four Geoprobe borings and four monitor wells to collect soil and groundwater samples. That work was performed on August 22, 23, and 28 and September 4, 2007, and this report presents the results of the investigation.

File No. 10-93-567-ST

If you have any questions or require additional information, please feel free to contact our office at 408-297-1500 or via email at info@envirosoiltech.com.

**DRILLING AND WELL INSTALLATION
SPRINGTOWN GAS
909 BLUEBELL DRIVE
LIVERMORE, CALIFORNIA**

1.0 INTRODUCTION

Enviro Soil Tech Consultants (ESTC) conducted an initial subsurface investigation of gasoline contamination at 909 Bluebell Drive in Livermore in February 2007. The site is located at the intersection of Springtown Boulevard and Bluebell Drive (Figure 1). Nine borings were drilled, and soil and groundwater samples were collected for laboratory analysis. Gasoline constituents, primarily methyl tertiary butyl ether (MTBE) and Tertiary Butanol (TBA), were detected in both media. The results were presented in a *Preliminary Investigation and Evaluation Report* (PIER) that was submitted to the regulatory agency (Alameda County Health Care Services Agency) in March.

Based on those results, the health care agency requested further investigation to determine the lateral and vertical extent of contamination. ESTC drilled two cone penetrometer test (CPT) borings in June, 2007, and the results were reported in the *Cone Penetrometer Drilling* report in July. This report presents data from additional drilling that was conducted in August and groundwater monitoring that was performed in September.

2.0 FIELD PROCEDURES

Drilling was conducted on August 22, 23, and 28. Vironex, Inc. mobilized a trailer-mounted direct-push (Geoprobe®) drilling rig to the site and drilled seven borings at the locations that were proposed or revised by ACHCSA. All of the borings were drilled to a depth of 20 feet. The borings were continuously logged, and samples were collected from the core at 5-foot intervals. In four of the borings, a disposal bailer was lowered to the bottom of the temporary casing and a water sample was collected. The samples were transferred to 40-ml glass vials and labeled and placed in a cooled ice chest. The other three borings were reamed out with 8-inch diameter hollow-stem augers and then converted to groundwater monitoring wells with 2-inch diameter PVC casing. Well construction details are shown in the logs for wells STMW-1 through STMW-3. Subsequently, the elevation of the top of the casing in each well was surveyed to mean sea level (see Appendix "J" – surveyor's report).

ESTC returned to the site on August 31 to develop and sample the wells on September 4, 2007. The depth to groundwater was measured in each well, and then they were hand-bailed until free of sediment. Samples were collected, transferred to 40-ml vials, and then placed into a cooled ice chest for transport to the laboratory.

3.0 RESULTS

As in the previous two phases of drilling, all borings penetrated predominantly fine-grained sediment. Stiff to friable clay, ranging from black to gray or light brown is dominant. Sand, ranging from fine grained to gravelly, is present in GP-3 and GP-4 from 14 to at least 20 feet and in GP-2 from 13 to 16 feet. This bed correlates with the sand bed that was previously logged in SB-3, SB-4, and CPT-2. All five borings penetrated this bed at about the same depth, and the log from CPT-2 indicates that the bed coarsens

downward to its base at about 19.5 feet. The bed is present only along the northern edge of the property, and it was not encountered in any of the other borings. This implies that it trends in a northeast-southwest direction, as illustrated in Figure 3.

A total of 28 soil samples were analyzed, and the results are summarized in Tables 3 and 4. No samples contained detectable concentrations of gasoline (TPHg) or any of the volatile aromatic components of gasoline (BTEX), but several samples contained methanol, MTBE, or TBA. Methanol was detected at 5 feet in STMW-2 (8.9 mg/Kg) and at 10 feet in GP-2 (5.2 mg/Kg). MTBE was detected at 5 feet in STMW-2 (0.460 mg/Kg) and at 15 feet in STMW-1 (0.066 mg/Kg). It was detected at 10 feet in GP-2 (0.039 mg/Kg) and at 10 and 20 feet in GP-3 (0.012 and 0.034 mg/Kg, respectively). Unlike the samples collected in the first drilling phase in February 2007, where MTBE was mostly localized at a depth of 15 feet, MTBE was not isolated in a narrow depth range in the samples collected in this phase.

TBA was detected in nine samples, at concentrations ranging from 0.270 to 3.70 mg/Kg. Like MTBE, it was detected at all depths between 5 and 20 feet.

Figure 4 is a contour map of the total MTBE and TBA concentration in the depth interval from 5 to 10 feet. The map was constructed by selecting the sample (5 or 10 feet) with the highest total concentration. Figure 5 is a similar map for the depth interval from 15 to 20 feet. The map at 5-10 feet reveals that concentrations are highest beneath the underground tanks and diminish westward to less than the detection limit beneath the dispenser islands. The eastern limit at this depth is east of GP-1, and could be east of the property line. With depth, the extent of the two gasoline oxygenates increases somewhat and the locus of highest concentrations apparently shifts northward, but the concentrations decline considerably. The concentrations are low or below the detection limit in the borings where the first sand bed (Figure 3) is present, suggesting that the oxygenates are preferentially adsorbed by the finer-grained deposits.

Gasoline was detected in three of the water samples, but MTBE and TBA were again the predominant species (Tables 1 and 5). Both of these compounds were detected in three of the four Geoprosbes, and TBA was detected in all three of the wells. Using these data and combining them with the results from samples collected in February and June yields the map in Figure 6. Like the map of soil contamination at 5-10 feet, the groundwater map indicates that concentrations are highest in the vicinity of the underground tanks and decrease with distance from them.

Depth-to-groundwater data were used to calculate the elevation of the water table and construct a groundwater elevation map (Figure 7). On September 4, the depth varied from about 6.5 to 9.5 feet below grade, which is considerable in view of the relatively flat terrain. Part of the depth difference is probably due to the fact that STMW-3 is located in the planter area along Bluebell Drive, which is slightly higher than the paved area where STMW-1 and STMW-2 are located. In any event, the water table is slightly higher on the south side of the dispenser area at STMW-2 than at either of the other locations, and the water table apparently slopes slightly toward the west.

4.0 CONCLUSIONS

The extent and location of the contaminant plume may come as somewhat of a surprise to the regulatory agency. Based apparently on regional data that suggest that groundwater in the area flows westward, ACHCSA requested ESTC to revise the previously proposed boring locations and move some of the borings and wells to the north and west, near the Bluebell Drive sidewalk. Rather than indicating that hydrocarbons have migrated in these directions from the dispensers and/or underground storage tanks, however, some of these borings encountered little or no contaminated soil

or groundwater. For example, the fact that neither soil nor water samples from monitor well STMW-3 and boring GP-4 were impacted implies that the contaminants have not migrated downgradient toward the west. This confirms data from previous drilling, which showed that concentrations in SB-2 and SB-3 are low. Instead, higher concentrations are present around the north and east ends of the tank pit, and the highest concentrations are directly beneath the underground storage tanks. It is important to note, however, that even there the concentrations are not extremely high, meaning that the overall mass of hydrocarbons is fairly low relative to many similar sites.

Contamination is present over a relatively limited depth range, from the surface to about 20 or perhaps 25 feet. Water samples from CPT borings below this depth were not impacted. Clay, with variable amounts of silt, sand, and gravel, is the principal sediment type in this interval, and the only coarser-grained deposit above 30 feet is a sand bed that is a few to several feet thick on the northern edge of the property. Hydrocarbon concentrations in this bed tend to be lower than in the more common clayey beds, and it appears that much of the mass of the contaminants is locked up within the fine-grained beds and is relatively immobile.

5.0 RECOMMENDATIONS

Because a moderate level of groundwater contamination is indicated by the results of this phase of drilling, we recommend starting a quarterly monitoring program for this site. Hydrocarbon concentrations are too low to be indicative of free-phase product, so it will not be necessary to monitor for hydrocarbon sheen or odor, but water depths should be measured and samples collected for analysis. The site should be re-evaluated after one year of monitoring to determine whether monitoring should continue or additional investigation is warranted.

6.0 LIMITATIONS

This report and the schedule work have been provided in accordance with the general principles and practices currently employed in the environmental consulting profession. The contents of this report reflect the conditions of the site at this particular time. The findings of this report are based on:

1. The observations of field personnel.
2. The results of laboratory analyses performed by a state-certified laboratory.

This report is issued with the understanding that it is the responsibility of the owner or his/her representative to ensure that the information herein is called to the attention of the Local Environmental Agency.

Services performed by ESTC has been in accordance with generally accepted environmental professional practices for the nature and conditions of the work complete in the sample or similar localities at the time the work was performed. This report is not meant to represent a legal opinion. No other warranty, express or impacted is made.

STANDARD OPERATION PROCEDURES

ENVIRO SOIL TECH CONSULTANTS

DRILLING AND SOIL SAMPLING PROCEDURE

A direct push technology (Geoprobe) tool with hollow-stem auger was used in drilling the soil borings to the desired depths.

Prior to drilling, all drilling equipment was thoroughly steam-cleaned to minimize the possibility of cross-contamination and/or vertical migration of possible contaminants.

In addition, sampling equipment was washed between samples with Tri-sodium Phosphate (TSP) solution or an equivalent EPA-approved detergent followed by a rinse in distilled water.

During the drilling operation, undisturbed soil samples were taken from the required depth by forcing a 2-inch sampler lined with polyethylene or brass tubes driven into undisturbed sediments at the bottom of the borehole by means of hydraulic push technologies.

The selected sampling tubes were immediately trimmed, the ends covered tightly with aluminum foil and plastic caps, sealed with tape labeled, placed in a plastic bag and stored in a cold ice chest in order to minimize the escape of any volatile present in the samples. Soil samples were sent to a state-certified hazardous waste laboratory for analysis accompanied by a chain-of-custody record.

Soil samples collected at each sampling interval were inspected for any possible contamination (odor or peculiar colors). Soil vapor concentrations were measured in the field by using a Photoionization Detector (PID), Photovac Tip Air Analyzer. The soil sample was sealed in a Zip-Loc plastic bag and placed in the sun to enhance volatilization of the hydrocarbons from the sample. The purpose of this field analysis is to qualitatively determine the presence or absence of hydrocarbons and to establish which soil samples were analyzed at the laboratory. The data was recorded on the drilling log at the depth corresponding to the sampling point.

Other soil samples may be collected to document the stratigraphy and estimate relative permeability of the subsurface materials.

Soil tailings that are obtained during drilling were stored at the site, pending the analytical test results to determine proper disposal.

MONITORING WELL INSTALLATION

The boreholes for the monitoring wells were hand augered to the depth of 5-feet in order to detect any underground buried lines with a diameter of at least two inches larger than the casing outside diameter (O.D.).

The monitoring wells were cased with threaded, factory-perforated and blank, schedule 40 PVC. The perforated interval consisted of slotted casing, generally 0.010 to 0.040 inch wide by 1.5-inch long slot size, with 42 slots per foot (slots which match formation grain size as determined by field grain-size distribution analysis). A PVC cap was fastened to the bottom of the casing (no solvents, adhesive, or cements were used), the well casing was thoroughly washed and steam-cleaned.

After setting the casing inside the borehole, kiln-dried sand or gravel-filter material was poured into the annular space to fill from the bottom of the boring to two feet above the perforated interval. Half-a-foot to two feet thick bentonite plug was placed above this filter material to prevent grout from infiltrating down into the filter material. Approximately one to two gallons of distilled water was added to hydrate the bentonite pellets. Then the well was sealed from the top of the bentonite seal to the surface with concrete or neat cement containing about 5% bentonite (see Well Construction Detail).

To protect the well from vandalism and surface water contamination, Christy box with a special type of Allen screw was installed around the wellhead, (for wells in parking lots, driveways and building areas). Steel stove pipes with padlocks were usually set over wellheads in landscaped areas.

In general, groundwater monitoring wells extend to the base of the upper aquifer, as defined by the consistent (less than 5 feet thick) clay layer below the upper aquifer, or at least 10 to 15 feet below the top of the upper aquifer, whichever is shallower. The wells do not extend through the laterally extensive clay layer below the upper aquifer. The wells are terminated one to two feet into such a clay layer.

WELL DEVELOPMENT

For all newly installed groundwater monitoring wells, the well casing, filter pack and adjacent formations were cleared of disturbed sediment and water.

Well development techniques including pumping, bailing, surging, swabbing, jetting, flushing or air lifting by using a stainless steel or Teflon bailer, a submersible stainless steel pump, or air lift pump. The well development was continued until the discharged water appeared to be relatively free of all turbidity.

All water and sediment generated by well development was collected in 55-gallon steel drums (Department of Transportation approved), closed head (17-H) for temporarily storage, and then was disposed of properly, depending on analytical results.

To assure that cross-contamination did not occur between wells, all well development tools were steam-cleaned or thoroughly washed in a Trisodium Phosphate (TSP) solution followed by a rinse in distilled water before each well development.

GROUNDWATER SAMPLING

Prior to collection of groundwater samples, all of the sampling equipment (i.e. bailer, cables, bladder pump, discharge lines and etc...) was cleaned by pumping TSP water solution followed by distilled water.

Prior to purging, the well “Water Sampling Field Survey Forms” was filled out (depth to water and total depth of water column will be measured and recorded). The well then was bailed or pumped to remove four to ten well volumes or until the discharged water temperature, conductivity and pH stabilized. “Stabilized” is defined as three consecutive readings within 15% of one another.

The groundwater sample was collected when the water level in the well recovered to 80% of its static level.

Forty milliliter (ml.) glass volatile organic analysis (VOA) vials with Teflon septa were used as sample containers. The groundwater sample was decanted into each VOA vial in such a manner that there was a meniscus at the top. The cap quickly was placed over the top of the vial and securely tightened. The VOA vial was then be inverted and tapped to see if air bubbles are present. If none is present, then the sample was labeled and refrigerated for delivery under chain-of-custody to the laboratory. The label information has included a sample identification number, job identification number, date, time, type of analysis requested and the sampler’s name.

Certificate of Analysis - Final Report

On August 23, 2007, samples were received under chain of custody for analysis.

Entech analyzes samples "as received" unless otherwise noted. The following results are included:

<u>Matrix</u>	<u>Test / Comments</u>
Liquid	Alcohols: EPA 5030B/ EPA 8015B Electronic Deliverables for Geotracker TPH-Purgeable - GC : EPA 5030B / EPA 8015B VOCs: EPA 5030B / EPA 8260B for Groundwater and Water - EPA 624 for Wastewater

Entech Analytical Labs, Inc. is certified for environmental analyses by the State of California (#2346).

Certificate of Analysis - Final Report

On August 23, 2007, samples were received under chain of custody for analysis.
Entech analyzes samples "as received" unless otherwise noted. The following results are included:

<u>Matrix</u>	<u>Test / Comments</u>
Solid	Alcohols: EPA 5030B/ EPA 8015B Electronic Deliverables for Geotracker TPH-Purgeable - GC: EPA 5030B (or 5035A for Encore Samples only) / EPA 8015B VOCs: EPA 5030B (or 5035A for Encore Samples only)/EPA 8260B

Entech Analytical Labs, Inc. is certified for environmental analyses by the State of California (#2346).
If you have any questions regarding this report, please call us at 408-588-0200 ext. 225.

Sincerely,

C. L. Thom
Laboratory Director

Certificate of Analysis - Final Report

On August 24, 2007, samples were received under chain of custody for analysis.
Entech analyzes samples "as received" unless otherwise noted. The following results are included:

<u>Matrix</u>	<u>Test / Comments</u>
Solid	Alcohols: EPA 5030B/ EPA 8015B Electronic Deliverables for Geotracker TPH-Purgeable - GC: EPA 5030B (or 5035A for Encore Samples only) / EPA 8015B VOCs: EPA 5030B (or 5035A for Encore Samples only)/EPA 8260B

Entech Analytical Labs, Inc. is certified for environmental analyses by the State of California (#2346).
If you have any questions regarding this report, please call us at 408-588-0200 ext. 225.

Sincerely,

C. L. Thom
Laboratory Director

Certificate of Analysis - Final Report

On August 29, 2007, samples were received under chain of custody for analysis.
Entech analyzes samples "as received" unless otherwise noted. The following results are included:

<u>Matrix</u>	<u>Test / Comments</u>
Solid	Alcohols: EPA 5030B/ EPA 8015B Electronic Deliverables for Geotracker TPH-Purgeable - GC: EPA 5030B (or 5035A for Encore Samples only) / EPA 8015B VOCs: EPA 5030B (or 5035A for Encore Samples only)/EPA 8260B

Entech Analytical Labs, Inc. is certified for environmental analyses by the State of California (#2346).
If you have any questions regarding this report, please call us at 408-588-0200 ext. 225.

Sincerely,

C. L. Thom

Certificate of Analysis - Final Report

On September 05, 2007, samples were received under chain of custody for analysis.

Entech analyzes samples "as received" unless otherwise noted. The following results are included:

<u>Matrix</u>	<u>Test / Comments</u>
Liquid	Alcohols: EPA 5030B/ EPA 8015B Electronic Deliverables for Geotracker VOCs: EPA 5030B / EPA 8260B for Groundwater and Water - EPA 624 for Wastewater TPH-Purgeable - GC : EPA 5030B / EPA 8015B

Entech Analytical Labs, Inc. is certified for environmental analyses by the State of California (#2346).
If you have any questions regarding this report, please call us at 408-588-0200 ext. 225.

Sincerely,

C. L. Thom

CCN ft. CCE ft.
APN CLIENT
Name Masood Amini Filabadi
Address 909 Bluebell Drive Phone 925-371-0994
City Livermore Zip 94551

PERMIT CONDITIONS

(Circled Permit Requirements Apply)

A.

GENERAL

1. A permit application should be submitted so as to arrive at the Zone 7 office five days prior to proposed starting date.
2. Submit to Zone 7 within 60 days after completion of permitted work the original Department of Water Resources Water Well Drillers Report or equivalent for well projects or drilling logs and location sketch for geotechnical projects.
3. Permit is void if project not begun within 90 days of approval date.

B.

WATER SUPPLY WELLS

1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth is 50 feet for municipal and industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth is specially approved.
3. An access port at least 0.5 inches in diameter is required on the wellhead for water level measurements.
4. A sample port is required on the discharge pipe near the wellhead.

C.

GROUNDWATER MONITORING WELLS INCLUDING PIEZOMETERS

1. Minimum surface seal thickness is two inches of cement grout placed by tremie.
2. Minimum seal depth for monitoring wells is the maximum depth practicable or 20 feet.

D.

GEOTECHNICAL. Backfill bore hole with compacted cuttings or heavy bentonite and upper two feet with compacted material. In areas of known or suspected contamination, tremied cement grout shall be used in place of compacted cuttings.

E.

CATHODIC. Fill hole above anode zone with concrete placed by tremie.

F.

WELL DESTRUCTION. See attached.

G.

SPECIAL CONDITIONS. Submit to Zone 7 within 60 days after the completion of permitted work the well installation report including all soil and water laboratory analysis results.

Approved

Date 8/21/07

Wyman Hong

I hereby agree to comply with all requirements of this permit and Alameda County Ordinance No. 73-68.
