**Re: Completed underground tank closure at 1925 Barcelona St.,
Livermore (former Chevron #9-7314)**

Dear Mr. Randall:

As you're aware, on September 18, 1989, four underground storage tanks were removed from the above facility, and soil samples were collected and analyzed according to guidelines established by the San Francisco Regional Water Quality Control Board. EA Engineering Science & Technology had conducted earlier soil studies that found elevated levels of petroleum hydrocarbons, and the sample results taken during the tank removal verified widespread soil contamination. However, following several rounds of excavation and sampling, it appears that all contaminated soil has been removed from the site. In addition, groundwater beneath this site is reported at a depth of approximately 85 feet below ground surface.

Based on the information outlined above, no further site remediation is needed at this time. Please be aware that this does not free present or future landowners or operators from cleanup responsibilities in the event that new information indicates a pollutant problem on the site or originating from the site, either in soil or in groundwater.

If you have any questions about this letter, please contact the undersigned at 271-4320.

Sincerely,

A handwritten signature in cursive script that reads "Gilbert M. Wistar".

Gil Wistar
