Subject: **Fourth Quarter 2012 Groundwater Monitoring and Sampling Report**
Former F&M Auto Service UST Site
Alameda County, Case # RO 3077
1839 Foothill Boulevard, Oakland, California

Dear Ms. Detterman:

On behalf of Ms. Mary Wright, current property owner, and Mr. James Balsley, prospective property owner, Sierra West Consultants, Inc. (Sierra West) is pleased to provide this *Fourth Quarter 2012 Groundwater Monitoring and Sampling Report* for the Former F&M Auto Service Underground Storage Tank (UST) Site located at 1839 Foothill Boulevard, Oakland, California (Site). The Site is located at the northwest corner of the intersection of Foothill Boulevard and 19th Avenue, in Oakland, California. A Site Location Map is included as **Figure 1**.

This quarterly report presents Site background information, groundwater level measurements, groundwater sampling and analytical testing results, and a request for modification of the groundwater monitoring program.

Site Background

The Site is identified by Alameda County Assessors Parcel Number 20-164-6, and is a rectangular lot surrounded by a chain link fence with approximate dimensions of 100 feet long by 40 feet wide. The Site is a former gasoline service station that is estimated to have been constructed sometime during the 1950's. The service station ceased operation in 1995 and an auto detailing service operated at the property from 1997 through 2001. The property has been unoccupied since 2001. The southern section of the Site consisted of a small metal-framed retail building with an overhead canopy that covered a concrete pad and a dispenser island containing three gasoline pumps. The northern section of the Site consisted of a metal-framed structure that included a storage shed, an auto service garage, and a canopy that covered waste oil containers and other equipment.

There were a total of four USTs at the Site. UST#1 and UST#2 each had a capacity of 1,000-gallons, contained gasoline during operation of the service station, and were located at the southern end of the Site. UST#3 had a capacity of 550-gallons, and was located in the central portion of the Site. UST#3 contained gasoline during operation of the service station. UST#4 had a capacity of 100-gallons, and was located at the northern end of the Site. UST#4 likely contained oil during operation of the service station. The Site structures were demolished and the four USTs and surrounding soils were removed between March 29 and April 8, 2011.

During the subsequent environmental assessment performed in January 2012, soil borings B-1 through B-3 were drilled and monitoring wells MW-1 through MW-4 were installed at the Site. Analysis of soil and groundwater samples from the soil borings and monitoring wells showed that the greatest hydrocarbon impacts are present in the vicinity of former UST#1 and UST#2. Hydrocarbon impacts were also observed in the vicinity of former UST#3, and low level detections of methyl tertiary butyl ether (MTBE) near laboratory reporting limits were also observed near former UST#4. Results from this investigation are described in Sierra West's *Site Conceptual Model with Soil and Groundwater Investigation Results Report*, submitted to Alameda County Environmental Health (ACEH) on March 9, 2012. Locations of the monitoring wells, soil borings, and former Site features including structures and USTs, are shown on the Site Plan included as **Figure 2**.

Groundwater Level Measurements

Groundwater level measurements were taken on December 13, 2012, from groundwater wells MW-1 through MW-4. Free phase hydrocarbons were not encountered in any of the monitoring wells. A copy of the well gauging data sheet is included in **Attachment A**, and a summary of historical groundwater elevation data is presented in **Table 1**. Groundwater flow across the Site was generally to the south with a hydraulic gradient of approximately 0.118 feet per foot (ft/ft). A groundwater elevation contour map is included as **Figure 3**.

Groundwater Sampling

Groundwater samples were collected from monitoring wells MW-1 through MW-4 on December 13, 2012. Sampling was performed using the three-volume purge method with a centrifugal pump. Copies of the well sampling data sheets are included in **Attachment A**. The samples were delivered, under chain-of-custody (COC) protocol, to Accutest Laboratories, a State-of-California certified laboratory located in San Jose, California. Samples were analyzed for the following:

- Total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, xylenes (BTEX), methyl tertiary butyl ether (MTBE), diisopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA) by Environmental Protection Agency (EPA) Method 8260B;
- Total petroleum hydrocarbons as diesel (TPHd) by EPA Method 8015M; and,
- Dissolved lead by EPA Method 6010B.

Due to its proximity to the former waste oil tank, samples collected from MW-3 were also analyzed for the following:

- Oil and grease by EPA Method 1664A with silica gel cleanup;
- Cadmium (Cd), chromium (Cr), nickel (Ni), and zinc (Zn) by EPA Method 6010B;
- Chlorinated hydrocarbons, ethylene dibromide (EDB), and 1,2-Dichloroethane (1,2-DCA) by EPA Method 8260B;
- Polychlorinated biphenyls (PCBs), pentachlorophenol (PCP), polynuclear aromatic hydrocarbons (PNAs), and 1,4-dioxane by EPA Method 8270; and,
- Creosote compounds by EPA Method 3510C.

A copy of the certified laboratory analytical report with COC documentation is included as **Attachment B**. A summary of current and historical analytical results is included as **Table 1**.

Groundwater Analytical Results

The primary constituents of concern in groundwater beneath the Site are TPHd, TPHg, BTEX constituents, and MTBE. A tabular summary of groundwater testing results is presented below. The summary also includes a comparison with applicable environmental screening limits (ESLs), as defined by the San Francisco Bay Regional Water Quality Control Board (RWQCB) in *Screening for Environmental Concerns at Sites with Contaminated Soil and Groundwater – Table B* (November, 2007), for shallow soils where groundwater is not a current or potential source of drinking water.

Analytical Results from the Fourth Quarterly Event of 2012

Well ID	TPHd µg/L	TPHg µg/L	B µg/L	T µg/L	E µg/L	X µg/L	MTBE µg/L	DIPE µg/L	ETBE µg/L	TAME µg/L	TBA µg/L	Dissolved Lead µg/L
MW-1	506	16,100	3,440	1,240	283	941	596	<100	<100	<100	<500	<10
MW-2	322	3,670	39.7	2.3 ^J	15.8	13.2	76.0	<10	2.9 ^J	<10	<50	<10
MW-3	<94	<50	<1.0	<1.0	<1.0	<2.0	3.1	<2.0	<2.0	<2.0	<10	<10
MW-4	<96	<50	<1.0	<1.0	<1.0	<2.0	<1.0	<2.0	<2.0	<2.0	<10	<10
ESL	180	180	46	130	43	100	1,800	NA	NA	NA	18,000	2.5

Notes:

- ESLs for DIPE, ETBE, and TAME have not been established by the RWQCB.
- Concentrations exceeding their respective ESLs are presented in **bold**.
- ^J indicates an estimated value, as reported by laboratory.

Consistent with previous observations, the greatest constituent concentrations in groundwater were observed in MW-1. MW-1 is located immediately downgradient of the former location of UST#1 and UST#2, where the highest concentrations were observed during UST removal and excavation. The results from the fourth quarterly event of 2012 are summarized below:

- In the sample collected from MW-1, concentrations of TPHd, TPHg, and BTEX constituents all exceeded their respective ESLs.
- In the sample collected from MW-2, concentrations of TPHg and TPHd exceeded their respective ESLs. MTBE was present at a relatively low concentration of 76 micrograms per liter (µg/L).
- In the sample collected from MW-3, MTBE was detected at a concentration of 3.1 µg/L, but no other primary constituents of concern were detected above laboratory reporting limits. As shown in **Table 2**, none of the waste oil specific constituents at MW-3 were detected above their respective laboratory reporting limits, except dissolved nickel at a concentration of 60.8 µg/L.
- No constituents were observed above their laboratory reporting limits in the sample collected from MW-4.

A groundwater concentration map, including iso-concentration lines for TPHg, is included as **Figure 4**.

Modifications to Quarterly Groundwater Monitoring Program

Quarterly groundwater monitoring has been performed for one year, and sufficient data have been collected to verify the presence/absence of Site constituents. Based on groundwater analytical results, Sierra West proposes the following modifications to the groundwater monitoring program:

Remove DIPE, ETBE, TAME, and TBA Analyses for Each Well

The oxygenates DIPE, TAME, and TBA have not been detected in any of the samples collected from wells MW-1 through MW-4. ETBE has not been detected in any of the samples collected from MW-1, MW-3, or MW-4, but has been detected at low-level concentrations with the laboratory annotation "estimated value" in each of the groundwater samples collected from MW-2. Given that the concentrations of ETBE are low-level, have the "estimated value" annotation, and are only observed in one monitoring well, ETBE is not considered to be a primary constituent of concern. As such, ongoing analysis for DIPE, ETBE, TAME, and TBA is not warranted and these compounds should no longer be required as part of the groundwater monitoring program.

Remove Dissolved Lead Analysis for Each Well

During the first quarterly event of 2012, dissolved lead was detected in wells MW-1, MW-2, and MW-3 at concentrations of 86.4 µg/L, 63.5 µg/L, and 14.1 µg/L, respectively. During the second quarterly event of 2012, dissolved lead was only detected in well MW-1 at a concentration of 10.5 µg/L. Dissolved lead has not been detected above reporting limits in any of the samples collected from MW-1 through MW-4 during the third and fourth quarters of 2012. As such, ongoing analysis for dissolved lead is not warranted and these compounds should no longer be required as part of the groundwater monitoring program.

Remove Waste-Oil Specific Analyses for MW-3

Due to its proximity to the former waste oil tank, groundwater samples collected from MW-3 have been analyzed for oil and grease, Cd, Cr, Ni, Zn, EDB, 1,2-DCA, PCBs, PNAs, 1,4-dioxane, and creosote compounds. None of these additional compounds have been observed during four quarters of monitoring, with the exception of the chemicals described below:

- During the third quarter 2012 sampling event, low-level detections of the semivolatile compounds benzoic acid, 3&4-methylphenol, phenol, diethyl phthalate, and bis (2-ethylhexyl) phthalate were observed. None of these compounds were detected during the first, second, or fourth quarter events, and their presence during the third quarter event is anomalous.
- During each of the sampling events, dissolved nickel was detected in samples collected from MW-3 at concentrations ranging from 32.8 µg/L to 60.8 µg/L. However, the concentrations of nickel are not attributable to impacts from the former USTs. In the City of Oakland's *Survey of Studies on Naturally-occurring Metals Concentrations*¹, background nickel concentrations in soil are estimated to range from 69.7 parts per million (ppm) to 144.3 ppm. As no other chemical impacts have been observed in samples collected from MW-3 (with the exception of low-level detections of MTBE), it is evident that the dissolved nickel concentrations are attributable to background conditions.

Given the explanations presented above, the additional analyses currently performed for well MW-3 are not warranted and these compounds should no longer be required as part of the groundwater monitoring program.

¹ <http://www2.oaklandnet.com/oakcal/groups/pwa/documents/report/oak026330.pdf>

Proposed Groundwater Monitoring Program

For future groundwater monitoring events, Sierra West proposes that the following analyses be performed at each well:

- TPHg, BTEX, and MTBE by EPA Method 8260B; and,
- TPHd by EPA Method 8015M.

Reduction in the number of compounds analyzed during each quarterly groundwater monitoring event will not only simplify the reporting requirements, but will also reduce the overall cost of assessment activities.

Future Work

The lateral extent of constituent impacts to soil and groundwater downgradient of MW-1 remain undefined. Near the source area, constituent concentrations in soil and groundwater indicate that vadose zone impacts may be present. Sierra West submitted the *Site Conceptual Model and Data Gap Work Plan* (Work Plan) on November 19, 2012 to address these data gaps, and is currently awaiting response from ACEH prior to implementation of the proposed scope of work. The F&M Auto Service UST Site environmental investigation is funded by the Orphan Site Cleanup Fund (OSCF), and the timeframe for funding through OSCF limited. As such, review comments and/or approval of the Work Plan is needed from ACEH in a timely manner.
