Dear Mr. Rush,

ERAS Environmental, Inc. (ERAS) is pleased to present the Technical Summary Report for the above referenced site (the "Property"). The Property was last occupied by Precision Cast and was used for the manufacture of steel products.

ERAS performed a soil investigation at the Property on March 27, 2002. Additional investigations were performed by Environmental Restoration Services (Enrest) on April 26 and May 21, 2002. This report summarizes historical and the results of the environmental investigations conducted on the Property.

Please call if you have any questions regarding the information presented in this report.

Respectfully,  
ERAS Environmental, Inc.

## **Introduction**

This report summarizes information gathered to date from various sources pertaining to the environmental conditions at the former Precision Cast building at 1549 32<sup>nd</sup> Street, Oakland, California (the Property). This summary includes historical land use and hazardous materials information, as well as the results of recent soil and groundwater sampling investigations. The location of the Property is shown on Figure 1, Site Location Map. The current layout of the Property is shown on Figure 2.

## **Purpose and Scope**

The purpose of this report is to summarize the known information pertaining to the Property regarding environmental conditions present. The information can be used by the local regulatory agency to determine if additional investigation and remediation is required prior to redevelopment of the Property. The current owner of the Property is planning to renovate the current building for occupancy as live/work residential space. Therefore, the analytical results for soil and groundwater samples discussed in this report are compared to the Risk-Based Screening Levels (RBSLs) for residential properties promulgated by the California Regional Water Quality Control Board (RWQCB) in December 2001.

## **Historical Information**

### Phase 1 ESA report

A Phase I Environmental Site Assessment (ESA) was prepared by Lumina Technologies (Lumina), dated January 4, 2001. At the time of the site inspection by Lumina, the building was vacant. Lumina noted poor maintenance and housekeeping in most areas. Lumina noted the spillage of dry materials associated with former foundry operations, and the storage of isopropyl alcohol on the Property. Lumina also noted the presence of a 500-gallon underground tank on the west side of the property under the sidewalk which was abandoned for at least 20 years.

Former uses of the Property were identified as a foundry and by Lindbergh Heating. Lumina indicated that the Property was developed with the current building in 1946. The Regional Water Quality Control Board (RWQCB), County of Alameda Environmental Health Department (EHD) and Department of Toxic Substance Control (DTSC) were contacted for file reviews. The RWQCB files indicated that no leaks or spills have occurred on the subject site. The EHD was contacted concerning spills of hazardous materials at the subject site, and no records were found which indicated that the subject site was involved in such a spill. Lumina indicated that the DTSC found no records that indicated any usage or storage of hazardous materials on the subject site.

Lumina concluded that there is evidence of potential environmental impairment of the site from prior site operations, and recommended subsurface sampling to test for heavy metals and total petroleum hydrocarbons.

### City of Oakland Records

ERAS reviewed the file for the Property at the City of Oakland Fire Department Emergency Services Division on March 12, 2002. The file for the Property contained a Hazardous Materials Business Plan (HMBP), dated July 18, 1997. The HMBP listed eight items that included a total of 990 gallons of liquid, 24,650 pounds of solid, and 275 cubic feet of gas.

The hazardous materials inventory form listed the following:

- chromium, 2 containers @ 4,000 pounds
- copper, 55 gallon container ~500 pounds
- manganese, 55 gallon container ~500 pounds
- nickel, two 55 gallon container ~1,000 pounds
- urethane, 55 gallons
- isopropyl alcohol, 55 gallons
- acetylene
- liquid petroleum gas
- oxygen

Inspections forms on file indicated the Property contained a steel foundry since 1983. An inspection dated October 15, 1996 indicated some resin on the ground in the drum storage area. The fire department did not indicate this was a serious problem and did not require any investigation or further action. No other violations were noted in the file other than minor compliance issues such as posting proper signs and labeling containers. The latest information, dated November 21, 2000, was another HMBP for Precision Cast that listed the same hazardous materials and no hazardous waste.

The file also contained an Analytical Request from the Alameda County Health Care Services Agency (ACHCSA) for analysis of a sample of the waste foundry sand that was stockpiled outside on the sidewalk along the Hannah Street side of the building. The sample was collected in response to a report by a concerned citizen, dated April 27, 1992, of the possibility of mishandling of hazardous waste and potentially discharging waste on the adjacent properties of others. ACHCSA collected a sand sample the same day and submitted it for analysis of heavy metals. The sample was found to contain metals well below the Total Threshold Limit Concentration (TTLC) that would deem the waste hazardous. A copy of the laboratory report is included in Appendix A.

Appendix A also includes the results of analysis of soil samples collected from four soil borings drilled on the Property in 1988 by Property Contamination Control, Inc. Although the report did not include information regarding the location of these borings, the results indicated concentrations of methanol in soil ranging from 0.68 milligrams per kilogram (mg/Kg) to 1.2 mg/Kg. Ethanol was detected in one sample at a concentration of 0.68 mg/Kg. Metals were detected at concentrations below TTLCs. Analysis for solvents indicated the presence of 1,1-dichloroethene (1,1-DCE) at concentrations ranging from 0.0076 mg/Kg to 0.1849 mg/Kg.

The concentration of 1,1-DCE detected in one of the borings (B-4, samples at 5 feet and 10 feet) is above the Regional Water Quality Control Board (RWQCB) Risk Based Screening Level (RBSL) for 1,1-DCE for residential land use of 0.028 mg/Kg (RWQCB, Table B, December 2001).

## **Summary of Subsurface Investigations in 2002**

### **GGTR**

A 700-gallon underground storage tank located along the Hannah Street side of the building was removed by Golden Gate Tank Removal (GGTR) on February 1, 2002 under permit requirements of the City of Oakland Fire Department (OFD). Evidence of staining was observed. Soil sample CTR collected at the base of the excavation was found to contain 7.95 mg/Kg TPH-g. GGTR performed additional excavation and a sample collected from the bottom of the excavation was found to contain less than 1 mg/Kg TPH-g. The OFD agreed that no further action was required and provided an underground storage tank case closure letter dated April 15, 2002. MTBS ?

### **ERAS**

ERAS Environmental, Inc. (ERAS) performed a limited Phase 2 soil investigation at the Property on March 27, 2002. Four soil borings were dug to about 3 feet bgs using a hand auger. The results of laboratory analysis of soil samples collected by ERAS from the base of each boring indicated elevated concentrations of total recoverable petroleum hydrocarbons (TRPH) in three of the samples (SB-1, SB-3 and SB-4). The sample collected in the southwest portion of the Property was not found to contain detectable TRPH or TPH-g concentrations. The concentrations of chemicals detected in the soil samples are summarized in **Table 1** below. The locations of the soil borings are shown on **Figure 2**.

The concentrations of TRPH were above the RBSLs for TRPH of 500 milligrams per kilogram (mg/Kg) in the samples collected from the northern, central, and south central portions of the site. The concentrations of total petroleum hydrocarbons as gasoline (TPH-g) and benzene, toluene, ethyl benzene, and xylenes (BTEX) were below the RBSLs for those respective constituents. During the investigation, a 4-inch diameter well pipe was observed near the location of SB-3. The well pipe was assumed to access an underground storage tank (UST). ERAS recommended the UST be removed.

### **Enrest**

Environmental Restoration Services (Enrest) was contracted by the owner to remove the UST and initiated excavation activities on April 15, 2002. During this work, Enrest found that the well pipe was actually a waste percolation well. The well extended to 7 feet bgs and was perforated at the bottom 18 inches. The base of the well was encased in drain rock that extended from 5 to 10 feet bgs. A representative of the Oakland Fire Department (OFD) requested that further soil be removed in the vicinity of the percolation well. On April 26, 2002, Enrest demolished the concrete lining of Pit B and excavated soil to 12 feet bgs. An excavation sidewall soil sample (SS-N) was collected near the top of groundwater at 10 feet bgs. This sample was found to contain 3,300 mg/Kg total petroleum hydrocarbons as motor oil (TPH-mo) but no detectable BTEX. An oil sheen was noted on groundwater collected in the excavation. Enrest also excavated casting sand backfill from Pit A and Pit C and collected sand samples. The locations of excavations and soil samples are shown on **Figures 2**.

*+Fig 3*

The owner requested that Enrest drill additional borings to further evaluate the extent and type of contaminants that might be present in the subsurface soil. Enrest drilled seven borings (SB-1 through SB-6 and P/A, Figure 2) using a Geoprobe rig on April 26, 2002. A soil sample was collected from boring P/A at 8 feet bgs and analyzed for VOCs. No detectable BTEX was detected in the soil sample SS-P/A.

Groundwater samples were collected from samples SB-1 through SB-5. The concentrations of chemicals detected in the soil samples are summarized in Table 1 below. The boring locations are shown on Figure 3.

Boring SB-6, was found to contain free-floating oil. Analysis of the oil indicated concentrations of benzene, toluene, xylenes (BTX), 1,2-dichlorobenzene (1,2-DCB) and naphthalene above the RBSLs for these constituents in soil. The oil sample was also analyzed for PCBs, but the previous reports did not contain a copy of the results of that analysis. Analysis of groundwater samples collected from borings (SB-1 through SB-5) indicated the concentrations of 1,2-DCB, BTX and naphthalene were below detection limits.

During this work in April 2002, Enrest noticed another 4-inch diameter well pipe near the southeast corner of the building.

Enrest recommended that the extent of product oil in the subsurface should be further investigated. In addition, Enrest recommended the City of Oakland review the results prior to performing additional investigation or remediation. On May 21, 2002, soil was excavated in the area of boring SB-6 and around the 4-inch pipe. Three soil borings, SP-1, SP-2, SP-3, were drilled for the collection of groundwater samples in locations north, west, and south, respectively, of the boring SB-6.

The 4-inch pipe was found to be another waste percolation well constructed the same as the one near Pit B. A sidewall soil sample (Source Pt) was collected at 7 feet bgs, near the top of groundwater, from the south wall of the excavation around the waste percolation well. This sample contained elevated concentrations of TPH-mo (20,800 mg/Kg) but no detectable concentrations of BTEX. Free-floating oil accumulated to a thickness of about 3/8-inch and was removed using a wet-vacuum prior to the collection of a sample of the standing groundwater. This sample was analyzed for VOCs only, and was found to contain only low concentrations of some compounds. However, because the top of groundwater in an open pit was subjected to a vacuum immediately prior to sample collection, which may have aerated the top of the groundwater, the usefulness of analysis of this sample for volatile compounds is uncertain.

Groundwater samples from SP-1, SP-2 and SP-3, and one designated Source, all within the estimated area of floating oil, contained high levels of TPH-mo (up to 5,780,000 ug/L). Concentrations of BTEX and solvents were much lower and below the RBSLs except for the sample from SP-3 which was found to contain benzene, xylenes, 1,2-dichlorobenzene, and naphthalene above the RBSLs.

The results of the analyses of soil samples collected by GGTR, ERAS and Enrest are summarized in **Table 1** below. The laboratory reports and chain-of-custody forms are included in **Appendices B, C and D**.

**TABLE 1 - Soil Sample Analytical Results (milligrams per kilogram)**

RBSLs		640	500	46	130	290	13	Various

**Notes:**

RBSL =	Risk Based Screening Levels from Regional Water Quality Control Board, Table B, December 2001
ND	Not detected at or above laboratory detection limits
NA	Not Analyzed
1	Sample contained chloroform 15 µg/L
2	Sample contained chloroform 3 µg/L
3	Sample contained acetone 375 µg/L (RBSL 1,500), 1,2-dichlorobenzene 6 µg/L (RBSL, 14)
4	Sample contained 1,2-dichlorobenzene 17 µg/L (RBSL, 14), napthalene 139 µg/L, (RBSL, 24), gasoline constituents
5	Sample contained 1,2-dichlorobenzene 2 µg/L (RBSL, 14), napthalene 2 µg/L (RBSL, 24), gasoline constituents

Some of the samples of soil (SS-P/A, Pit A, Source Pt. @7') and groundwater (SP-1, SP-2, SP-3 and Source) contained a number of solvents that are normal constituents of gasoline. These do not have separately listed RBSLs and are as follows.

1,2,4 Trimethylbenzene  
1,3,5 Trimethylbenzene  
sec-butylbenzene  
n-butyl benzene  
n-propyl benzene  
SUR-dibromofluoromethane  
SUR-Toluene-d8  
SUR-4-bromofluorobenzene

*Surrogates*

Note the presence of these solvents is not unexpected since gasoline hydrocarbons were detected in the shallow soil samples collected by ERAS. In addition, several of the samples including the oil collected from boring SB-6 contained concentrations of other gasoline constituents (BTX).

### Subsurface Conditions

According to information presented on boring logs for SP-1 through SP-3 prepared by Enrest, subsurface sediments beneath the concrete floor and underlying baserock consisted of high plasticity clay and silty clay to a depth of approximately 7 feet. These sediments were underlain by silty sand to the base of the borings at 11 feet bgs. Groundwater was reported to be encountered at depths of approximately 7 to 10 feet in the excavations produced by Enrest. Observations on the boring logs SP-1, SP-2 and SP-3 indicated groundwater was very slow entering the borings (more than 12 hours).

### Summary and Conclusions

The Property was formerly occupied by Precision Cast and operated as a steel product foundry. Information existing prior to 2002 indicated there were no liquid hazardous materials used at the facility. Analysis of used casting sand indicated it was a non-

hazardous material. Soil samples collected from soil borings at the Property indicated only 1,1-dichloroethene at concentrations above the current RBSL. However, the locations of these borings is unknown.

A 700-gallon UST was removed from the sidewalk along Hannah Street in February 2002. A soil sample collected from the base of the final excavation was found to contain less than 1 mg/Kg TPH-g.

Soil samples collected at 2.5-3 feet from hand auger borings drilled on the Property in March 2002 indicated concentrations of TRPH at concentrations above the current RBSL. A 4-inch well pipe found in the central area of the building was later determined during excavation to be a waste percolation well. Subsequent excavations were performed investigate the subsurface and to remove used casting sand. Soil borings were drilled and soil and groundwater samples collected for analysis in April 2002. In May 2002, additional excavation was performed and additional borings drilled.

During these investigations, three areas of contamination have been identified.

1. The northern portion of the building, TRPH contamination in the shallow soil of unknown impact to the deeper soil or groundwater.
2. Around the waste percolation well in the central portion of the building, TPH-mo contamination in the soil and floating oil sheen on groundwater was demonstrated to be of limited impact to the groundwater.
3. Around the waste percolation well near the southeast corner of the building, an area of significant thickness of free-floating oil on the groundwater with TPH-mo contamination in the soil and TPH-mo and VOC contamination in the groundwater above RBSLs.

#### Northern Area

Soil sample SB-1 comprised of green hydrocarbon-stained clay at 2.5 feet bgs was found to contain 8,300 mg/Kg TRPH, well above the RBSL of 1,000 mg/Kg. The impact to groundwater, if any, or the horizontal and vertical extent of soil contamination is unknown.

#### Central Area

In the excavation around the central waste percolation well, floating oil sheen was observed on the groundwater and TPH-mo of 3,300 mg/Kg in soil remained on the south sidewall of the excavation. However, groundwater samples SB-1 through SB-4 demonstrate that the horizontal extent of free-floating oil, and groundwater contamination is contained within a radius of roughly 12 to 15 feet around the waste percolation well.

#### Southeast Area

A significant thickness floating oil encountered in boring SB-6 and in the excavation around the waste percolation well near the south corner of the building. A sidewall sample from the excavation (Source Pt) was found to contain a very high concentration of TPH-mo (20,800 mg/Kg). The TRPH detected in the shallow soil at boring SB-4 located west of Pit A may be a result of contamination from the source near the southeast corner of the

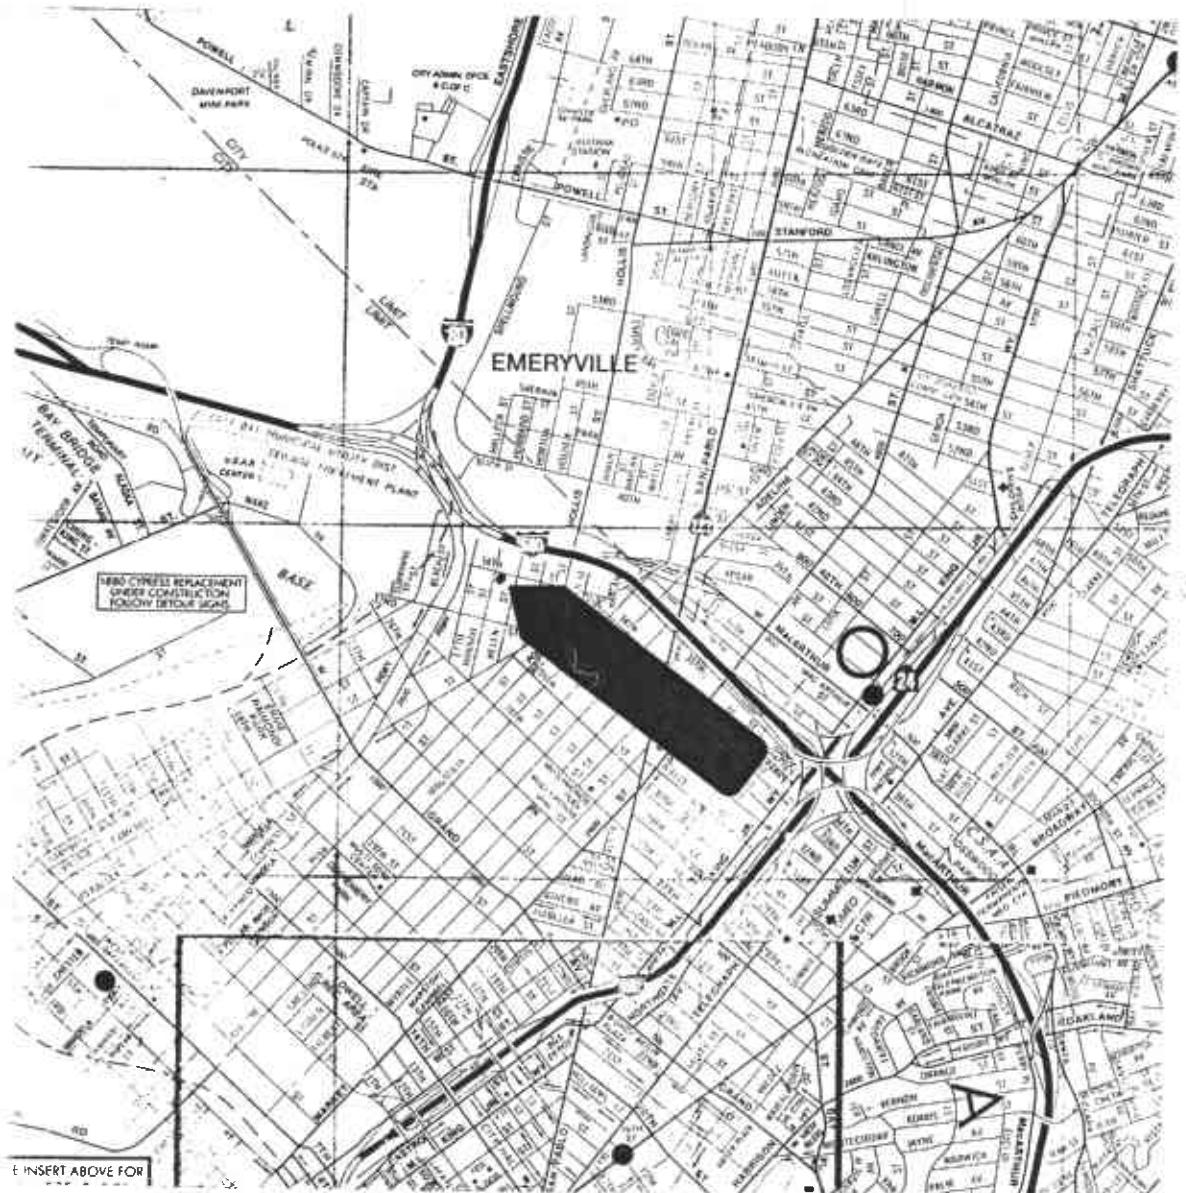

building. If so, the shallow soil sample SB-2, located southwest of SB-4 may indicate that soil contamination does not extend more than 35 feet west of soil sample SB-4.

Elevated concentrations of TPH-mo was detected in the groundwater samples from borings SP-1 and SP-2 located north and west of the waste percolation well. However, the groundwater samples SB-2 and SB-3, in which TPH-mo concentrations were not detected, indicate that groundwater contamination associated with the southeast source does not extend more than roughly 10 to 20 feet north of locations SP-1 and SP-2.

The soil in boring SP-3 below 7 feet bgs was described as stained green with a hydrocarbon odor. Also, the analytical result of 5,780,000 µg/L TPH-mo indicated that separate-phase oil was included in the groundwater sample. Therefore, free-floating oil and groundwater contaminant (TPH-mo and VOCs) plume extends to the southern wall of the building. ~~The horizontal extent of floating oil and groundwater contamination to the south and east has not been delineated.~~

### **Limitations**

This report has been prepared by ERAS according to the State and local agency suggested guidance documents for these investigations and in general accordance with the accepted standard of practice which exists in Northern California at the time the investigation was performed. The interpretations, conclusions and recommendations made herein are based upon the data and analysis for the soil and water samples collected on-site. ERAS is not responsible for errors in laboratory analysis and reporting, or for information withheld during the course of the study. The purpose of this study is to screen for the presence of contamination that may affect the use or value of the Property. As such, the evaluation of the geologic and environmental conditions on this site are made with very limited data. Judgements leading to conclusions are generally made with an incomplete knowledge of the conditions present. Additional conditions and materials could exist at the site that were not encountered during this investigation. No warranty or guarantee is expressed or implied therein.

selenium		5	500
silver		7.0	700
thallium		24	2,400
vanadium		250	5,000
zinc	27		

Note: Since the STLC limits are based on an extract of 50g. diluted to 500ml.  
 the total metal concentration must exceed ten times the STLC limit before  
 the extract need be analyzed.

Oakland, CA. 94623

Mr. Donald L. Torkington

Dear Mr. Torkington;

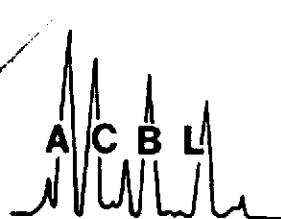

Attached you will find Bore log details with soils data and analytical results from the sampling at 2868 Hannah St. Oakland, CA.

Of the many properties we have tested in West Oakland the Hannah St. property is one of the cleanest we have tested. As tested your results are well below Federal and State action levels for soil. The results are also below State of California Total Threshold Limit Concentrations for those compounds tested.

The 1985 cleanup addressed a surface soil contamination problem. We have not reviewed the 1985 final analytical result, however our testing has confirmed the validity of the States final letter which indicates that no further remediation is required on the property.

Sincerely,

Ron Richmond

## REPORT RE: PRECISION CAST PRODUCTS

### Sample Identification:

Project : Precision Cast Products, Hannah Street,  
  Oakland, CA.  
ACBL Sample # 6135 : Soil sample B-1, 5'.

# 6136 : Soil sample B-1, 10'.  
# 6137 : Soil sample B-2, 5'.  
# 6138 : Soil sample B-2, 10'.  
# 6139 : Soil sample B-3, 5'.  
# 6140 : Soil sample B-3, 10'.  
# 6141 : Soil sample B-4, 5'.  
# 6142 : Soil sample B-4, 10'.

Date Sampled : 11/17/88, by Aqua Science Engineers.

Received in Lab : 11/18/88, 4:55 pm.

### Analysis:

Alcohol Scan by GC, modified EPA Method 8015, 11/29-30/88.  
California Total Toxic Metals (TTLC) digestion with scan by ICP,  
EPA Method 6010, 11/28-29/88.  
Halogenated Volatile Organics, EPA Method 8010, 12/1/88.  
Aromatic Volatile Organics, EPA Method 8020, 12/1/88.

## Notes and Definitions

- HC-12 Hydrocarbon pattern is present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
- QM-06 Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values.
- QM-07 The spike recovery was outside control limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

1,1,1,2-Tetrachloroethane	ND<5
Ethylbenzene	ND<5
Xylene, Isomers m & p	ND<10
o-Xylene	ND<5
Styrene	ND<5
Bromoform	ND<5
Isopropylbenzene	ND<5
Bromobenzene	ND<5
1,1,2,2-Tetrachloroethane	ND<5
n-Propylbenzene	ND<5
2-Chlorotoluene	ND<5
4-Chlorotoluene	ND<5
1,3,5-Trimethylbenzene	14
tert-Butylbenzene	ND<5
1,2,4-Trimethylbenzene	7
1,3-Dichlorobenzene	ND<5
1,4-Dichlorobenzene	ND<5
sec-Butylbenzene	ND<5
1,2-Dichlorobenzene	8
n-Butylbenzene	35
Naphthalene	ND<10
1,2,4-Trichlorobenzene	ND<5
Hexachlorobutadiene	ND<5
1,2,3-Trichlorobenzene	ND<5
1,2,3-Trichloropropane	ND<5
Acetonitrile	ND<250
Acrylonitrile	ND<250
Isobutanol	ND<250
1,1,1-Trichloroethane	ND<5
SUR-Dibromofluoromethane	127
SUR-Toluene-d8	110
SUR-4-Bromofluorobenzene	84
