March 11, 2016

Mr. Mark Detterman
Alameda County Department of Environmental Health
1131 Harbor Parkway, Suite 250
Alameda, CA 94502

SUBJECT: VAPOR INTRUSION INVESTIGATION REPORT CERTIFICATION
County Case # RO 3182
Emeryville Chevron
1400 Powell Street
Emeryville, California

Dear Mr. Detterman:

You will find enclosed one copy of the following document prepared by P&D Environmental, Inc. for the subject site

- Vapor Intrusion Investigation Report (VP1 Through VP4; IA1 Through IA3, and AA1) dated March 11, 2016 (document 0719.R1).

I declare under penalty of perjury that the contents and conclusions in the document are true and correct to the best of my knowledge.

Should you have any questions, please do not hesitate to contact me at (510) 653-2251.

Sincerely,

Emery Service Center, Inc.

Najmeddin Revan
President

SUBJECT: VAPOR INTRUSION INVESTIGATION REPORT
(VP1 THROUGH VP4, IA1 THROUGH IA3, AND AA1)
County Case # RO 3182
Emeryville Chevron
1400 Powell Street
Emeryville, CA

Dear Mr. Najmeddin:

P&D Environmental, Inc. (P&D) has prepared this report documenting vapor intrusion investigation activities at the subject site. All activities were performed in accordance with P&D's Vapor Intrusion Investigation Work Plan dated February 2, 2016 (document 0719.W1), and were performed in response to a request from the Alameda County Department of Environmental Health (ACDEH) based on development of a portion of the property for use of a burrito shop. P&D's February 2, 2016 work plan was approved in a letter from the ACDEH dated March 10, 2016.

Site activities included installation of four Vapor Pins, initial collection of indoor air samples after the Heating Ventilation and Air Conditioning (HVAC) system was shut off for a minimum of 36 hours, followed by the collection of indoor air samples with the HVAC system operating for a minimum of 36 hours, and the collection of soil gas samples from the Vapor Pins immediately following the collection of the indoor air samples with the HVAC on. Indoor air sample collection duration was 24 hours for each indoor air sampling event, and one ambient air sample was collected during each indoor air sampling event.

The Vapor Pins were installed on February 8, 2015. Following the completion of a facility chemical inventory, the initial indoor air sampling event that occurred after the HVAC system had been shut off for a minimum of 36 hours was performed beginning on February 10, 2016 and ended on February 11, 2016. The second indoor air sampling event that occurred after the HVAC system had been operating for a minimum of 36 hours was performed beginning on February 16, 2016 and ended on February 17, 2016, with the Vapor Pin sampling performed on February 17, 2016 immediately following the completion of the second indoor air sample collection event.

A Site Location Map is attached with this work plan as Figure 1, a Site Vicinity Aerial Photograph showing the current location of fuel USTs and the former location of a waste oil UST at the site is attached as Figure 2, and a Site Aerial Photograph Detail showing indoor and ambient air sample collection locations and the Vapor Pin sub-slab soil gas sample collection locations is attached as Figure 3. All work was performed under the direct supervision of an appropriately licensed California professional.

BACKGROUND

The site is presently operated as a gasoline station. Fuel release county case number RO 67 was closed by the ACDEH on May 30, 2014. Section IV of the case closure required that a change to any land use other than a fueling station required notification to the ACDEH for further evaluation based on potential vapor intrusion to indoor air considerations. In 2015 a burrito shop was constructed at the site with the eastern portion of the burrito shop constructed immediately adjacent to a former waste oil UST pit (see Figure 2). The ACDEH subsequently requested that the current property owner enter into a Voluntary Remedial Action Agreement for the ACDEH to evaluate potential vapor intrusion associated with the new burrito shop as ACDEH case number RO 3182.

The western portion of the building located at the subject site to the east of the gasoline station convenience store is presently occupied by a dry cleaner pick up and drop off facility, and the eastern portion of the building located at the subject site to the east of the gasoline station convenience store is presently vacant.

The adjacent property located to the north of the subject site was historically operated as a fuel bulk plant. The shallowest historical depth to water at the subject site in the vicinity of the new burrito shop has been identified as less than 5 feet below the ground surface. Historical site investigation summary documents are attached with this report as Appendix F.

FIELD ACTIVITIES

Prior to performing field activities, a health and safety plan was prepared, access to the sampling space was scheduled with the tenant, a chemical inventory was performed, and notification of the sample collection dates was provided to the ACDEH.

Chemical Inventory

An inventory of all chemicals at the new burrito shop was performed on February 4, 2016 in preparation for indoor air sample collection for vapor intrusion investigation. Chemicals identified to potentially contain chemicals that could interfere with indoor air testing were removed from the building at least 48 hours prior to indoor air sampling. Copies of the chemical inventory forms are attached with this report as Appendix A.

Vapor Pin Installation

Flush-mounted Vapor Pins designated as VP1 through VP4 were installed through the building floor slab at the approximate locations shown in Figure 3 by IMX, Inc. of Oakland, California on February 8, 2016 to evaluate the presence of petroleum soil vapor concentrations beneath the building floor slab. The Vapor Pins and flush-mounted stainless steel secured covers were installed in accordance with manufacturer recommended installation procedures, and were left in place with the flush-mounted covers following sample collection pending review of the sample results by the ACDEH. The locations shown in Figure 3 vary slightly from the proposed locations shown in the work plan based on access constraints associated with the facility use.

The boreholes for each Vapor Pin extended to a depth of approximately 2 inches below the floor slab, and each drilling location were evaluated to verify that the concrete slab had been fully penetrated. No soil was removed from the ground at any of the drilling locations, and for this reason no boring logs were prepared.

At the conclusion of Vapor Pin installation the HVAC system for the new burrito shop was shut off with the understanding with the burrito shop operator that the HVAC system would remain off until the completion of the indoor air sample collection event that was scheduled to begin on February 10, 2016.

Indoor Air and Ambient Air Sample Collection

Beginning on February 10, 2016 at approximately 07:30 a.m., and ending on February 11, 2016 at approximately 07:40 a.m. indoor air samples were collected at locations designated as IA1 through IA3 inside the building and one ambient air sample was collected outside of the building on the roof after the HVAC system had been off for at least 36-hours. The air samples were collected during a 24-hour period using SIM-certified 6-liter Summa canisters equipped with SIM-certified 24-hour mass flow controllers, with one duplicate indoor air sample collected using a SIM-certified stainless steel tee. The ambient air sample was collected beginning before the indoor air samples were collected and ending after the indoor air samples had been collected. At all indoor air sample collection locations, the inlet to the Summa canisters were located between 4 and 6 feet above the ground surface using 4-foot long stainless steel SIM-certified canes connected to the flow controller.

The sample collection locations are shown in Figure 3. The locations shown in Figure 3 vary slightly from the proposed locations shown in the work plan based on access constraints associated with the facility use. In addition, the ambient air sample collection location was re-located based on UST vent pipe and roof HVAC exhaust location considerations.

After approximately 24 hours, the valves to the Summa canisters were closed with a minimum remaining vacuum of 2 inches of mercury, and the Summa canisters were stored in a box and promptly shipped to the laboratory for extraction and analysis. Chain of custody procedures were observed for all sample handling.

Following the completion of the initial air sampling event on February 11, 2016 the HVAC was restarted, and at least 36 hours after the HVAC system was restarted a second indoor air sampling event was performed starting on February 16, 2016 at approximately 07:45 a.m. and ending on February 17, 2016 at approximately 08:00 a.m. using methods described above. Measurements of Summa canister initial and final vacuums and sample collection start and end times were recorded on Air Sampling Data Sheets that are attached with this report as Appendix B.

Vapor Pin Sample Collection

On February 17, 2016 immediately following the completion of indoor air sample collection with the HVAC system operating, soil gas samples were collected from Vapor Pins VP1 through VP4. Each sample was collected in a shroud for leak detection purposes, with analysis of the shroud air tracer gas concentration for comparison with any tracer gas concentrations detected in the samples.

A soil gas sampling manifold with a 1-liter Summa canister as the sampling canister for each location (see Figure 4) was assembled in a shroud consisting of a 35-gallon Rubbermaid bin that had been modified by cutting viewing ports into the sides of the shroud and covering the viewing ports with transparent polycarbonate sheets. A hole measuring approximately two inches square in the bottom of the shroud allowed the shroud to cover the Vapor Pin while still allowing access to the Vapor Pin through the bottom of the shroud. At the time that the sampling manifold was assembled, the vacuum for the sample canister was verified with a vacuum gauge and recorded.

Prior to sampling the Vapor Pin, a 10 minute shut-in test of the sampling manifold was performed by closing the valve located between the filter and the pressure gauge, opening the purge canister valve, and recording the manifold system vacuum (see Figure 4). No purge testing for purge volume determination was performed. Following successful verification of the manifold shut-in test, a default of three purge volumes was extracted prior to sample collection. The purge volume was calculated based on the void space below the Vapor Pin plus the volume of the tube that extends through the Vapor Pin and the volume of the tubing that connects the Vapor Pin to the sample media. The purge time was calculated using a nominal flow rate provided by the flow controller of 150 cubic centimeters per minute. Purge volume calculations are provided in Appendix C.

Following completion of the purging of three volumes, a lid was placed onto the shroud and a tracer gas 1,1-Difluoroethane (DFA) was sprayed into the shroud interior for one second through a tube connected to a hole in the side of the shroud. Gloves in the lid of the shroud were used to open the sample canister valve. After verifying that low flow conditions were not present associated with the soil gas sample, an air sample was collected from the shroud atmosphere to quantify the shroud tracer gas concentration while the soil gas sample was being collected. The shroud atmosphere sample was collected into a Tedlar bag that was placed into a vacuum chamber with the Tedlar bag inlet connected to a new piece of Teflon or polyethylene tubing that was inserted into the shroud atmosphere through a hole in the side of the shroud.

Once the vacuum for the sample canister valve had decreased to 5 inches of mercury, the gloves in the lid of the shroud were used to close the sample canister valve. The pressure gage on the inlet side of the flow controller (see Figure 4) was monitored during sample collection to ensure that the vacuum applied to the soil gas well did not exceed 100 inches of water. One duplicate soil gas sample was collected into a Summa canister from the Vapor Pin designated as VP4 using a stainless steel sampling tee for the Summa canisters using methods described above.

Following soil gas sample collection, a PID was connected to the Vapor Pin to obtain a preliminary field value for the sample collection location. The soil gas Summa canisters were stored in a box and the shroud air samples were stored in a cooler to prevent crushing and all of the samples were promptly shipped to the laboratory for extraction and analysis. Chain of custody procedures were observed for all sample handling.

In addition to collection of Summa canister soil gas samples as described above, sorbent tube soil gas samples were collected at each Vapor Pin as follows. Each manifold was equipped with a tee located downstream from the flow controller. At the time that the manifold was assembled (prior to the shut-in test), a sorbent tube was connected inside the shroud to the tee that was located downstream from the flow controller to a valve located between the sorbent tube and the tee. The downstream side of the sorbent tube was connected with a polyethylene tube to a flow meter and a vacuum pump.

Following Summa canister sample collection, the Summa canister was isolated from the manifold with a valve, and the valve between the manifold and the sorbent tube was opened. The tracer gas 2-Propanol was then placed into an open container in the shroud, a vacuum pump was used to apply a vacuum to the sorbent tube, and a flow meter was used to measure the soil gas flow rate at a nominal flow rate of 150 cubic centimeters per minute for collection of a 90 cubic centimeter sample. The laboratory did not provide a sorbent tube for the collection of a replicate sample at location VP4. For this reason a replicate sorbent tube sample analysis was not performed. Following collection of each sorbent tube soil gas sample the ends of the sorbent tube were sealed. Before and after connection of the sorbent tube to the manifold the sorbent tube were stored in a cooler with ice. During sorbent tube sample collection, a Tedlar bag air sample of the shroud atmosphere was collected using methods described above for characterization of shroud atmosphere tracer gas concentrations during soil gas sample collection. Chain of custody procedures were observed for all sample handling.

Measurements of vacuums, purging and equilibration time intervals, and PID readings were recorded on Soil Gas Sampling Data Sheets that are attached with this report as Appendix C.

All Vapor Pin construction equipment was cleaned with an Alconox solution wash followed by a clean water rinse prior to use at each location. New Vapor Pins with new silicone sleeves were used at each sample collection location. Clean, unused vacuum gages and stainless steel sampling manifolds were used at each sample collection location.

WEATHER

No precipitation occurred during the 10 days preceding the February 11, 2016 indoor and ambient air sample collection event or preceding or on the February 17, 2016 indoor and ambient air sample collection event and sub-slab soil gas sample collection event. Weather data, including precipitation and barometric pressure for the month of February 2016, including the dates of soil gas, indoor, and ambient air sample collection (February 11 and 17, 2016) are provided in Appendix D.

The weather station is located at on the north side of Powell Street west of Doyle Street in Emeryville at an elevation of 26 feet above sea level, approximately 600 feet to the east-northeast of the subject site. The subject site is located at an elevation of approximately 20 feet above sea level. An internet link to the weather station information is provided in Appendix D.

LABORATORY ANALYSIS

The indoor and ambient air samples, the Vapor Pin sub-slab soil gas samples collected with Summa canisters, the Vapor Pin sub-slab soil gas samples collected with sorbent tubes, and the associated shroud air samples were all analyzed at Eurofins Air Toxics, Inc. in Folsom, California (Air Toxics). The indoor and ambient air samples and the Vapor Pin sub-slab soil gas samples that were collected using Summa canisters were analyzed for Total Petroleum Hydrocarbons as Gasoline (TPH-G), benzene, toluene, ethylbenzene, and xylenes (BTEX), fuel oxygenates including methyl-tert-butyl ether (MTBE), and Halogenated Volatile Organic Compounds (HVOCs) including Tetrachloroethene (PCE), Trichloroethene (TCE), cis-1,2-Dichloroethene (cis-1,2-DCE), trans-1,2-Dichloroethene (trans-1,2-DCE), and vinyl chloride using EPA Method TO-15. The indoor and ambient air samples were also analyzed for naphthalene using EPA Method TO-15 and the Vapor Pin sub-slab soil gas samples that were collected using Summa canisters were also analyzed for the leak detection compound 1,1-Diflouroethane (DFA) using EPA Method TO-15, and for the gases oxygen, nitrogen, carbon monoxide, methane, carbon dioxide, ethane, and ethane using method ASTM D-1946.

The Vapor Pin sub-slab soil gas samples that were collected using sorbent tubes were analyzed for Total Petroleum Hydrocarbons as Diesel (TPH-D), naphthalene, and the leak detection compound 2-Propanol using EPA method TO-17. The shroud air samples associated with the Vapor Pin sub-slab soil gas samples collected in Summa canisters and also for the samples collected on sorbent tubes were analyzed for DFA and 2-Propanol using EPA Method TO-15.

The indoor and ambient air sample laboratory analytical results are summarized in Table 1. The soil gas TO-15 and TO-17 laboratory analytical results are summarized in Table 2A, the shroud air Tedlar bag sample results are summarized in Table 2B, and the soil gas ASTM D-1946 laboratory analytical results are summarized in Table 2C. The percent shroud information reported in Table 2A is the ratio of the detected tracer gas concentration in the soil gas sample to the corresponding shroud air tracer gas

concentration, expressed as a percentage. Copies of the laboratory analytical reports and chain of custody documentation are attached with this report as Appendix E.

RISK AND HAZARD ANALYSIS

In the absence of subsurface construction work, the only complete pathway for contaminant exposure at the subject site is considered to be potential vapor intrusion from soil gas to indoor air. Risk analysis is the evaluation of the predicted increased incidence of cancer resulting from exposure to Chemicals of Potential Concern (COPCs), and is reported for each COPC as the incremental carcinogenic risk. Hazard analysis is the evaluation of the predicted increased non-cancer adverse health effects resulting from exposure to COPCs, and is reported for each COPC as the hazard quotient. In addition, cumulative incremental carcinogenic risk (the total of the risks posed by all of the COPCs in a sample when all of the individual COPC risks are added together) and hazard indices (the total of the hazards posed by all of the COPCs in a sample when all of the individual COPC hazards are added together) were also calculated for all detected compounds for each sample.

The incremental carcinogenic risk and hazard quotient were calculated for each detected compound for each of the indoor and ambient air samples using equations for health risk-based screening levels considering a single chemical for indoor air inhalation provided in section 3.2.3 of the Interim Final February 2016 San Francisco Bay RWQCB User's Guide: Derivation and Application of Environmental Screening Levels (the User's Guide). The Inhalation Unit Risk factor (IUR) value used for risk calculation and the Reference Concentration (RfC) value used for hazard calculation were obtained from the February 2016 SFRWQCB User's Guide Table IP-2 Toxicity Values, and were verified to be consistent with the Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note Number 3 dated January 2016 and the US Environmental Protection Agency Region 9 Regional Screening Level indoor air values for compounds that were detected that are not listed in HHRA Note Number 3.

TPH-G is not considered to be a carcinogen, and for this reason there is no IUR for TPH-G, and risk is not calculated for TPH-G. In addition, DTSC does not provide a TPH-G RfC for hazard evaluation. The TPH-G RfC of 570 µg/m^3 that was used for calculation of the TPH-G hazard was obtained from the February 2016 RWQCB User's Guide Table Table IP-2.

Default exposure values provided in the February 2016 SFRWQCB User's Guide Table IP-3 for a commercial exposure scenario of

- Exposure time of 8 hours per day,
- Exposure frequency of 250 days per year, and
- Exposure duration for 26 years

and default parameter values provided in the DTSC HERO Vapor Intrusion Screening Model for Soil Gas VLOOKUP Table (last updated December 2014) of

- Averaging time for carcinogens of 70 years, and
- Averaging time for non-carcinogens of 26 years

were used for evaluation of all of the indoor and ambient air samples. In addition, the cumulative incremental carcinogenic risk (the total of the risks posed by all of the Chemicals of Potential Concern (COPCs) in a sample when all of the individual COPC risks are added together) and hazard indices (the total of the hazards posed by all of the COPCs in a sample when all of the individual COPC hazards are added together) were calculated for all detected compounds for each indoor air sample.

The indoor air and associated ambient air incremental risk calculation results are provided in Table 3A, and the indoor and associated ambient air hazard quotient calculation results are provided in Table 3B. The indoor and associated ambient air cumulative incremental carcinogenic risk and hazard index results are summarized in Table 3C.

HISTORICAL SITE INVESTIGATION DOCUMENTS

The subject property is presently occupied by an active gasoline station convenience store that is located in the central portion of the north side of the property. The new burrito shop is located to the west of the gasoline station convenience store. A building located to the east of the gasoline station convenience store has historically been subdivided into two tenant spaces. The western portion of the building that is located to the east of the gasoline station convenience store is presently occupied by a dry cleaner pick up and drop off facility, and the eastern portion of the building that is located to the east of the gasoline station convenience store was formerly occupied by a real estate office and is presently vacant.

The adjacent property located to the north of the subject site was historically operated as a fuel bulk plant. Historical subject site investigation documents are presented in Appendix F with this report as follows:

- Figure 2 – Groundwater Elevation and Hydrocarbon Concentration Map (Shallow Zone) for February 19, 2012 prepared by Conestoga-Rovers & Associates,
- Figure 4 – Groundwater Elevation Contour Map (Shallow Zone) for July 29, 2012 prepared by Arcadis,
- Figure 7B – Groundwater Elevation Contour and Hydrocarbon Concentration Map (Shallow Zone) for January 16, 2013 prepared by Arcadis,
- Figure 6 – Grab Groundwater Sampling Results (Post-Excavation and Dewatering Event) prepared by Arcadis (this figure shows CPT locations),
- Figure 7 – Groundwater Analytical Results for July 29, 2012 prepared by Arcadis,
- Table D-3 - Groundwater Analytical Results (Upgradient Dewatering Wells DW-11 and DW-14, 2 pages)
- Table D-1 - Groundwater Analytical Results (CPT Groundwater Samples From CPT-1 Through CPT-4, 2 pages)

- Table 2 - Groundwater Monitoring Data and Analytical Results for 2011 Through First Quarter 2013 (1 page).

The shallowest historical depth to water at the subject site in the vicinity of the new burrito shop has been identified as less than 5 feet below the ground surface. A rose diagram provided in Appendix F Figure 2 shows the calculated groundwater flow direction at the site to be predominantly westerly to southwesterly, with a range of ground water flow directions that include northwesterly to southwesterly. Figures 4 and 7B in Appendix F show westerly groundwater flow directions on July 29, 2012 and January 16, 2013.

Historical groundwater quality results in the vicinity of the northeast corner of the subject site were evaluated for potential vapor intrusion concerns associated with the subject site building that is located at the northeast corner of the subject site (to the east of the subject site gasoline station convenience store).

The closest shallow groundwater sample collection locations to the building located at the northeast corner of the subject site are identified on the figures in Appendix F as follows:

- Upgradient offsite dewatering well DW-11,
- Onsite cone penetration test location CPT-1, and
- Onsite groundwater monitoring well MW-3A (shallow).

The closest groundwater sample collection locations to the new burrito shop that is located at the northwest corner of the subject site (to the west of the subject site gasoline station convenience store) are identified on the figures in Appendix F as follows:

- Offsite dewatering well DW-14, and
- Onsite groundwater monitoring well MW-2A (shallow).

Review of groundwater quality data tables in Appendix F for groundwater samples collected at locations DW-11, MW-3A and CPT-1 shows the following:

- Table D-3 shows that in upgradient dewatering well DW-11 the compounds TPH-G, MTBE, benzene, and ethylbenzene were not detected.
- Table D-1 shows that in sample CPT-1@6-9' the compounds TPH-D, TPH-G, benzene, and ethylbenzene were detected at concentrations of 260, 690, 42, and 59 µg/L, respectively.
- Table 2 shows that in well MW-3A from 2011 to 2013 the concentration of benzene decreased from 160 µg/L to 19 µg/L, and that ethylbenzene and MTBE were detected at maximum concentrations of 98 and 2.8 µg/L, respectively. Additionally, Figures 6 and 7 of Appendix F show groundwater grab sample results from post-excavation dewatering activities north of the site in 2009 and 2010 and groundwater well sample results from samples collected from well MW-3A on July 29, 2012, respectively. Review of Figure 7 shows that detected petroleum, MTBE,

and BTEX concentrations are less in well MW-3A than the detected concentrations in wells located downgradient of well MW-3A.

Review of groundwater quality data tables in Appendix F for groundwater samples collected at locations DW-14 and MW-2A shows the following:

- Table D-3 shows that in dewatering well DW-14 the compounds TPH-G, benzene, and ethylbenzene were detected at maximum concentrations of 1,800, 55 and 41 ug/L and that MTBE was not detected.
- Table 2 shows that in well MW-2A from 2011 to 2013
    - TPH-G ranged from 1,300 to 2,800 ug/L,
    - Benzene ranged from 150 to 860 ug/L,
    - Ethylbenzene concentrations ranged from 14 to 28 ug/L,
    - MTBE concentrations ranged from 140 to 320 ug/L, and
    - TBA concentrations ranged from 1,300 to 3,400 ug/L.

DISCUSSION AND RECOMMENDATIONS

Review of Table 1 shows that comparison of the indoor air sample results that were collected with the HVAC off (on 2/11/16) with the indoor air sample results that were collected with the HVAC on (on 2/17/16) shows that the sample results were similar.

Review of Table 1 shows that benzene was detected in all of the samples and that naphthalene was detected in one of the indoor air samples (sample IA3 which was collected with the HVAC off) exceed their corresponding February 2016 SFRWQCB Table IA-1 Indoor Air Direct Exposure Human Health Risk Levels (ESL) for commercial land use. The benzene indoor air results were consistent with the benzene ambient air results, indicating that vapor intrusion of benzene was not detected. The naphthalene air sample results also showed that naphthalene was not detected at concentrations exceeding SFRWQCB February 2016 indoor air ESL values for commercial land use when the HVAC was operating.

Review of the Table 2A Percent Shroud columns shows that the tracer gas concentrations detected in the samples are less than 5 percent of the associated shroud atmosphere tracer gas concentrations (see Table 2B) for all of the sub-slab soil gas samples except for duplicate sample VP4-DUP, indicating that atmospheric dilution of the samples during sample collection is not a concern except for duplicate VP4-DUP where 42.31 percent of the associated shroud atmosphere tracer gas DFA concentration was detected. Review of Table 2 sub-slab soil gas sample results shows that none of the detected sub-slab soil gas concentrations exceed either the residential or commercial industrial February 2016 SFRWQCB Table SG-1 Subslab/ Soil Gas Vapor Intrusion Human Health Risk Levels (ESLs).

Review of Table 1C shows that oxygen was detected in sub-slab soil gas samples VP1, VP2, VP3, VP4, and duplicate VP4-DUP all at 20 percent and nitrogen was detected in each of these samples at 80 percent. Methane was detected in samples VP1, VP2, and VP3

at concentrations of 0.00060, 0.00051, and 0.00085 percent, respectively, and carbon dioxide was detected in VP4-DUP at a concentration of 0.028 percent.

Based on the sub-slab soil gas and the indoor air sample results, vapor intrusion is not considered to be a concern for the new burrito shop.

Review of the historical groundwater information in Appendix F of this report shows that the building located to the east of the subject site gasoline station convenience store is located on the upgradient side of the site. Review of groundwater quality data for the subject site shows that petroleum hydrocarbon concentrations in groundwater exceed their respective February 2016 SFRWQCB Table GW-3 Groundwater Vapor Intrusion Human Health Risk Levels (ESLs) for many of the detected compounds.

Based on the absence of sub-slab soil gas concentrations exceeding their respective Table SG-1 ESL values beneath the new burrito shop, and the absence of evidence of detected petroleum concentrations in air exceeding their respective commercial ESL values when the HVAC is operating in the new burrito shop, petroleum in groundwater in the western portion of the site where the highest groundwater concentrations are encountered does not result in unacceptable amounts of vapor intrusion. Based on these conditions vapor intrusion in the eastern portion of the property where the lowest petroleum concentrations in groundwater are encountered is similarly considered to not result in unacceptable amounts of vapor intrusion.

Based on the absence of unacceptable amounts of vapor intrusion at the site P&D recommends that no further investigation be performed and that the case be closed.

DISTRIBUTION

A copy of this report should be uploaded to the Alameda County Environmental Health Department ftp website with a letter on company letterhead identifying the contact information for the responsible party. In addition, a copy of this report should also be uploaded to the GeoTracker website.

LIMITATIONS

This report was prepared solely for the use of Emery Service Center, Inc. The content and conclusions provided by P&D in this assessment are based on information collected during our investigation, which may include, but not be limited to, visual site inspections; interviews with site owner, regulatory agencies and other pertinent individuals; review of available public documents; subsurface exploration and our professional judgment based on said information at the time of preparation of this document. Any subsurface sample results and observations presented herein are considered to be representative of the area of investigation; however, geological conditions may vary between boreholes and may not necessarily apply to the general site as a whole. If future subsurface or other conditions are revealed which vary from these findings, the newly revealed conditions must be evaluated and may invalidate the findings of this report.

This report is issued with the understanding that it is the responsibility of the owner, or his representative, to ensure that the information contained herein is brought to the attention of the appropriate regulatory agencies, where required by law. Additionally, it is the sole responsibility of the owner to properly dispose of any hazardous materials or hazardous wastes left onsite, in accordance with existing laws and regulations.

This report has been prepared in accordance with generally accepted practices using standards of care and diligence normally practiced by recognized consulting firms performing services of a similar nature. P&D is not responsible for the accuracy or completeness of information provided by other individuals or entities which is used in this report. This report presents our professional judgment based upon data and findings identified in this report and interpretation of such data based upon our experience and background, and no warranty, either express or implied, is made. The conclusions presented are based upon the current regulatory climate and may require revision if future regulatory changes occur.

Should you have any questions, please do not hesitate to contact us at (510) 658-6916.

Sincerely,

Notes:

TPH-G = Total Petroleum Hydrocarbons as Gasoline.

MTBE = Methyl-tert-Butyl Ether

PCE = Tetrachloroethene

TCE = Trichloroethene

cis-1,2-DCE = cis-1,2-Dichloroethene

trans-1,2-DCE = transs-1,2-Dichloroethene

ND = Not Detected.

a = Laboratory Note: Estimated Value.

ESL[1] = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, Updated February 22, 2016, from Table IA-1 – Indoor Air Direct Exposure Human Health Risk Screening Levels for Commercial/Industrial Land Use.

Results in bold exceed their respective ESL[1] values.

Results and ESLs in micrograms per cubic meter (ug/m^3), unless otherwise noted.

Table 2A

Summary of Sub-Slab Soil Gas Sample Analytical Results - TPH-D, TPH-G and VOCs

Sample ID	Land Use	Sample Date	Sand Pack Interval (Feet bgs)	Probe Depth (Feet bgs)	TPH-D	TPH-G	MTBE	Benzene	Toluene	Ethyl-benzene	m,p-Xylenes	o-Xylenes	TBA	Naphthalene	PCE	DFA	Percent Shroud	2-Propanol	Percent Shroud

Notes:

Feet bgs = Feet Below Ground Surface.

TPH-D = Total Petroleum Hydrocarbons as Diesel.

TPH-G = Total Petroleum Hydrocarbons as Gasoline.

MTBE = Methyl-tert-Butyl Ether.

TBA = tert-Butyl alcohol.

PCE = Tetrachloroethene.

DFA = 1,1-Difluoroethane. (tracer gas)

ND = Not Detected.

NA = Not Analyzed.

NR = Not Reported, matrix interference.

a = Laboratory Note: exceeds instrument calibration range.

Percent Shroud = The ratio of tracer gas concentration detected in the soil gas sample to the tracer gas concentration detected in the shroud air sample, expressed as a percentage.

ESL[1] = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated February 22, 2016 from Table SG1 – Subslab/Soil Gas Vapor Intrusion: Human Health Risk Levels for Residential Land Use.

ESL[2] = Environmental Screening Level, by San Francisco Bay – Regional Water Quality Control Board, updated February 22, 2016 from Table SG1 – Subslab/Soil Gas Vapor Intrusion: Human Health Risk Levels for Commercial/Industrial Land Use.

Values in bold exceed their respective ESL[1] values.

Underlined values exceed their respective ESL[2] values.

Results in micrograms per cubic meter (µg/m3), unless otherwise indicated.

Table 2B

Summary of Soil Gas Shroud Sample Analytical Results - 1,1-Difluoroethane and 2-Propanol

Sample ID	Sample Date	DFA, #	2-Propanol, ##
SG2 2-Propanol	7/23/2014	NA	8,600,000
SG2 DFA	7/23/2014	31,000,000	NA
SG4 2-Propanol	8/13/2014	570,000	NA
SG4 DFA	8/13/2014	22,000,000	NA
VP1 2-Propanol	2/17/2016	NA	500,000
VP1 DFA	2/17/2016	590,000	NA
VP2 2-Propanol	2/17/2016	NA	140,000
VP2 DFA	2/17/2016	14,000,000	NA
VP3 2-Propanol	2/17/2016	NA	93,000
VP3 DFA	2/17/2016	18,000,000	NA
VP4 2-Propanol	2/17/2016	NA	400,000
VP4 DFA	2/17/2016	26,000,000	NA

Notes:

ND = Not Detected.

NA = Not Analyzed.

= 1,1-Difluoroethane (DFA) used as leak detection compound for TO-15 analysis.

= 2-Propanol used as leak detection compound for TO-17 analysis.

Results in micrograms per cubic meter ($\mu g/m^3$), unless otherwise indicated.

Table 2C

Summary of Soil Gas Sample Analytical Results - Oxygen, Nitrogen, Carbon Monoxide, Methane, Carbon Dioxide, Ethane, and Ethene

Sample ID	Sample Date	Probe Depth (Feet bgs)	Oxygen (%)	Nitrogen (%)	Carbon Monoxide (%)	Methane (%)	Carbon Dioxide (%)	Ethane (%)	Ethene (%)

APPENDIX C

Purge Volume Calculations and Soil Gas Sampling Data Sheets

Report 0719.R1
4.0 inch slab, recessed Vapor Pin, 2.0 feet tubing

Soil Gas Purge Volume Calculations

One Purge Volume is calculated as

1 The volume of the hole through the slab,
2 Plus the volume of the hole beneath the slab,
3 Plus the volume of the tube in the Vapor Pin,
4 Plus the volume of the tube connecting the Vapor Pin to the sample container,
5 Less the volume of the hole through the slab for any drilling for recessed Vapor Pin placement
6 Less the volume of the Vapor Pin

1 The slab borehole volume is calculated as follows:

Borehole slab dia. = 0.625 inches (this is 5/8 inch diameter)
Slab Thickness = 4 inches
V borehole = pi x (r x r) x h, where pi = 3.14, r = 0.625 in./2, and h = 4.0 in.
V borehole = 3.14 x (0.3125 x 0.3125) x (4.0 in.) = 1.23 cubic inches.

2 The sub-slab borehole volume is calculated as follows:

Borehole slab dia. = 0.625 inches (this is 5/8 inch diameter)
Depth below slab = 2 inches
V borehole = pi x (r x r) x h, where pi = 3.14, r = 0.625 in./2, and h = 2.0 in.
V borehole = 3.14 x (0.3125 x 0.3125) x (2.0 in.) = 0.61 cubic inches.

3 The Vapor Pin tube volume is calculated as follows:

Tubing diameter = 0.125 inches
Tubing Length = 2 inches
V borehole = pi x (r x r) x h, where pi = 3.14, r = 0.125 in./2, and h = 2.0 in.
V borehole = 3.14 x (0.0625 x 0.0625) x (2.0 in.) = 0.02 cubic inches.

4 The tube volume connecting the Vapor Pin to the sample container is calculated as follows:

Tubing diameter = 0.187 inches
Tubing Length = 24 inches
V borehole = pi x (r x r) x h, where pi = 3.14, r = 0.187 in./2, and h = 24.0 in.
V borehole = 3.14 x (0.0935 x 0.0935) x (24.0 in.) = 0.66 cubic inches.

5 The slab borehole volume that is removed for the recessed Vapor Pin is calculated as follows:

Borehole slab dia. = 0.625 inches (this is 5/8 inch diameter)
Slab Thickness = 1.75 inches (if Vapor Pin is recessed this is 1.75 inches)
V borehole = pi x (r x r) x h, where pi = 3.14, r = 0.625 in./2, and h = 1.8 in.
V borehole = 3.14 x (0.3125 x 0.3125) x (1.8 in.) = 0.54 cubic inches.

6 The Vapor Pin volume is calculated as follows:

Vapor Pin diameter = 0.625 inches (this is 5/8 inch diameter)
Vapor Pin Length = 2 inches
V borehole = pi x (r x r) x h, where pi = 3.14, r = 0.625 in./2, and h = 2.0 in.
V borehole = 3.14 x (0.3125 x 0.3125) x (2.0 in.) = 0.61 cubic inches.

The total volume for one purge volume is V slab borehole + V sub-slab borehole + V vapor pin tube + V tubing connecting Vapor Pin to sample container

.- V slab borehole for recessed Vapor Pin - V vapor pin

V total = 1.23 cubic inches + 0.61 cubic inches + 0.02 cubic inches +
0.66 cubic inches - 0.54 cubic inches - 0.61 cubic inches = 1.37 cubic inches.

To convert to cubic centimeters:

V total = 1.37 cubic inches x 16.39 cubic centimeters/cubic inches = 22.5 cubic centimeters.

The total volume for 3 **purge volume(s)** is calculated as follows:

V purge total = 22.5 cubic centimeters x 3 = 67.5 cubic centimeters.

The flow controller has a nominal flow rate of 150 cubic centimeters per minute.

The purge time is calculated as follows:

T purge = 68 cubic centimeters/ 150 cubic centimeters per minute = 0.45 minutes.
Converting the purge time to seconds, 0.45 minutes x 60 seconds/ minute = 27 seconds.

Notes:

Yellow hi-lite indicates data entry required.
Blue hi-lite indicates values are calculated or automatically updated.

APPENDIX E

Laboratory Analytical Reports and Chain of Custody Documentation

Indoor and Ambient Air Samples- Collected February 11 and 17, 2016

- **Air Toxics W/O # 1602252 – IA1, IA1-DUP, IA2, IA3, and AA1 TO-15 Air Results**
- **Air Toxics W/O # 1602346A – IA1, IA1-DUP, IA2, IA3, and AA1 TO-15 Air Results**

Soil Gas and Shroud Samples - Collected February 17, 2016

- **Air Toxics W/O # 1602347A – VP1, VP2, VP3, VP4, and VP4-DUP TO-15 Soil Gas Results**
- **Air Toxics W/O # 1602323 – VP1, VP2, VP3, and VP4 TO-17 Soil Gas Results**
- **Air Toxics W/O # 1602321 – VP1, VP2, VP3, and VP4 Shroud Air Sample DFA Results**
- **Air Toxics W/O # 1602322 – VP1, VP2, VP3, and VP4 Shroud Air Sample 2-Propanol Results**
- **Air Toxics W/O # 1602347B – VP1, VP2, VP3, VP4, and VP4-DUP ASTM D-1946 Soil Gas Results**

Mr. Paul King
P & D Environmental
55 Santa Clara
Suite 240
Oakland CA 94610

Project Name: EMERYVILLE CHEVRON 1400 POWELL ST. EMVER
Project #: 0719
Workorder #: 1602252

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/11/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
Modified TO-15 Full Scan/SIM
P & D Environmental
Workorder# 1602252

Five 6 Liter Summa Canister (SIM Certified) samples were received on February 11, 2016. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the Full Scan and SIM acquisition modes. The method involves concentrating up to 1.0 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-15***	***ATL Modifications***
ICAL %RSD acceptance criteria	</=30% RSD with 2 compounds allowed out to < 40% RSD	For Full Scan: 30% RSD with 4 compounds allowed out to < 40% RSD For SIM: Project specific; default criteria is </=30% RSD with 10% of compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	For Full Scan: </= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers For SIM: Project specific; default criteria is </= 30% Difference with 10% of compounds allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The results for each sample in this report were acquired from two separate data files originating from the same analytical run. The two data files have the same base file name and are differentiated with a "sim" extension on the SIM data file.

As per project specific client request the laboratory has reported estimated values for Naphthalene and

Benzene hits that are below the Reporting Limit but greater than the Method Detection Limit. All The canisters used for this project have been certified to the Reporting Limit for the target analytes included in this workorder. Concentrations that are below the level at which the canister was certified may be false positives.

A single point calibration for TPH referenced to Gasoline was performed for each daily analytical batch. Recovery is reported as 100% in the associated results for each CCV.

Definition of Data Qualifying Flags

Nine qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

CN - See case narrative explanation

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project Name: EMERYVILLE CHEVRON 1400 POWELL ST
Project #: 0719
Workorder #: 1602346A

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/17/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free to the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
Modified TO-15 Full Scan/SIM
P & D Environmental
Workorder# 1602346A

Five 6 Liter Summa Canister (SIM Certified) samples were received on February 17, 2016. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the Full Scan and SIM acquisition modes. The method involves concentrating up to 1.0 liters of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***TO-15***	***ATL Modifications***
ICAL %RSD acceptance criteria	</=30% RSD with 2 compounds allowed out to < 40% RSD	For Full Scan: 30% RSD with 4 compounds allowed out to < 40% RSD For SIM: Project specific; default criteria is </=30% RSD with 10% of compounds allowed out to < 40% RSD
Daily Calibration	+- 30% Difference	For Full Scan: </= 30% Difference with four allowed out up to </=40%.; flag and narrate outliers For SIM: Project specific; default criteria is </= 30% Difference with 10% of compounds allowed out up to </=40%.; flag and narrate outliers
Blank and standards	Zero air	Nitrogen
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The results for each sample in this report were acquired from two separate data files originating from the same analytical run. The two data files have the same base file name and are differentiated with a "sim" extension on the SIM data file.

A single point calibration for TPH referenced to Gasoline was performed for each daily analytical batch. Recovery is reported as 100% in the associated results for each CCV.

As per project specific client request, the laboratory has reported estimated values for Benzene and Naphthalene hits that are below the Reporting Limit but greater than the Method Detection Limit. All the canisters used for this project have been certified to the Reporting Limit for the target analytes included in this workorder. Concentrations that are below the level at which the canister was certified may be false positives.

Definition of Data Qualifying Flags

Nine qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

CN - See case narrative explanation

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Project Name: EMERYVILLE CHEVRON 1400 POWERLL ST.
Project #: 0719
Workorder #: 1602347A

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/17/2016 at Air Toxics Ltd.

The data and associated QC analyzed by TO-15 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
EPA Method TO-15
P & D Environmental
Workorder# 1602347A

Five 1 Liter Summa Canister samples were received on February 17, 2016. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

The reported CCV for each daily batch may be derived from more than one analytical file due to the client's request for non-standard compounds. Non-standard compounds may have different acceptance criteria than the standard TO-14A/TO-15 compound list as per contract or verbal agreement.

Dilution was performed on samples VP3 and VP4-DUP due to the presence of high level target species.

A single point calibration for TPH referenced to Gasoline was performed for each daily analytical batch. Recovery is reported as 100% in the associated results for each CCV.

The hydrocarbon profile present in samples VP1, VP2 and VP4 did not resemble that of commercial gasoline. Results were calculated using the response factor derived from the gasoline calibration.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/17/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-17 VI are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free to the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

LABORATORY NARRATIVE
Modified EPA Method TO-17 (VI Tubes)
P & D Environmental
Workorder# 1602323

Four TO-17 VI Tube samples were received on February 17, 2016. The laboratory performed the analysis via modified EPA Method TO-17 using GC/MS in the full scan mode. TO-17 'VI' sorbent tubes are thermally desorbed onto a secondary trap. The trap is thermally desorbed to elute the components into the GC/MS system for compound separation and detection.

A modification that may be applied to EPA Method TO-17 at the client's discretion is the requirement to transport sorbent tubes at 4 deg C. Laboratory studies demonstrate a high level of stability for VOCs on the TO-17 'VI' tube at room temperature for periods of up to 14 days. Tubes can be shipped to and from the field site at ambient conditions as long as the 14-day sample hold time is upheld. Trip blanks and field surrogate spikes are used as additional control measures to monitor recovery and background contribution during tube transport.

Since the TO-17 VI application significantly extends the scope of target compounds addressed in EPA Method TO-15 and TO-17, the laboratory has implemented several method modifications outlined in the table below. Specific project requirements may over-ride the laboratory modifications.

Requirement	***TO-17***	***ATL Modifications***
Initial Calibration	%RSD</=30% with 2 allowed out up to 40%	VOC list: %RSD</=30% with 2 allowed out up to 40% SVOC list: %RSD</=30% with 2 allowed out up to 40%
Daily Calibration	%D for each target compound within +/-30%.	Fluorene, Phenanthrene, Anthracene, Fluoranthene, and Pyrene within +/-40%D
Audit Accuracy	70-130%	Second source recovery limits for Fluorene, Phenanthrene, Anthracene, Fluoranthene, and Pyrene = 60-140%.
Distributed Volume Pairs	Collection of distributed volume pairs required for monitoring ambient air to insure high quality.	If site is well-characterized or performance previously verified, single tube sampling may be appropriate. Distributed pairs may be impractical for soil gas collection due to configuration and volume constraints.
Analytical Precision	</=20% RPD	<30% RPD for Fluorene, Phenanthrene, Anthracene, Fluoranthene, and Pyrene.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

A sampling volume of 0.09 L was used to convert ng to ug/m3 for the associated Lab Blank.

The reported CCV and LCS for each daily batch may be derived from more than one analytical file.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:
B - Compound present in blank (subtraction not performed).

J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.
UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/17/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 (5&20 ppbv) are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

P & D Environmental
Workorder# 1602321

Four 1 Liter Tedlar Bag samples were received on February 17, 2016. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 50 mLs of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

Method TO-15 is validated for samples collected in specially treated canisters. As such, the use of Tedlar bags for sample collection is outside the scope of the method and not recommended for ambient or indoor air samples. It is the responsibility of the data user to determine the usability of TO-15 results generated from Tedlar bags.

Dilution was performed on samples VP1-DFA, VP2-DFA, VP3-DFA and VP4-DFA due to the presence of high level target species.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified

b-File was quantified by a second column and detector

r1-File was requantified for the purpose of reissue

Workorder #: 1602322

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/17/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified TO-15 (5&20 ppbv) are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
EPA Method TO-15 Soil Gas
P & D Environmental
Workorder# 1602322

Four 1 Liter Tedlar Bag samples were received on February 17, 2016. The laboratory performed analysis via EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 50 mLs of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Receiving Notes

The Chain of Custody (COC) information for samples VP1-2-PROPANOL, VP2 2-PROPANOL, VP3 2-PROPANOL and VP4-2-PROPANOL did not match the entries on the sample tags with regard to sample identification. Therefore the information on the COC was used to process and report the samples.

Analytical Notes

Dilution was performed on samples VP1-2-PROPANOL, VP2 2-PROPANOL, VP3 2-PROPANOL and VP4-2-PROPANOL due to the presence of high level target species.

Samples VP1-2-PROPANOL, VP2 2-PROPANOL, VP3 2-PROPANOL and VP4-2-PROPANOL were transferred from Tedlar bags into summa canisters to extend the hold time from 72 hours to 30 days. Canister pressurization resulted in a dilution factor which was applied to all analytical results.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit, LOD, or MDL value. See data page for project specific U-flag definition.

UJ- Non-detected compound associated with low bias in the CCV

N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:

a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Project Name: EMERYVILLE CHEVRON 1400 POWERLL ST.
Project #: 0719
Workorder #: 1602347B

Dear Mr. Paul King

The following report includes the data for the above referenced project for sample(s) received on 2/17/2016 at Air Toxics Ltd.

The data and associated QC analyzed by Modified ASTM D-1946 are compliant with the project requirements or laboratory criteria with the exception of the deviations noted in the attached case narrative.

Thank you for choosing Eurofins Air Toxics Inc. for your air analysis needs. Eurofins Air Toxics Inc. is committed to providing accurate data of the highest quality. Please feel free the Project Manager: Kyle Vagadori at 916-985-1000 if you have any questions regarding the data in this report.

Regards,

Kyle Vagadori

Project Manager

LABORATORY NARRATIVE
Modified ASTM D-1946
P & D Environmental
Workorder# 1602347B

Five 1 Liter Summa Canister samples were received on February 17, 2016. The laboratory performed analysis via Modified ASTM Method D-1946 for Methane and fixed gases in air using GC/FID or GC/TCD. The method involves direct injection of 1.0 mL of sample.

On the analytical column employed for this analysis, Oxygen coelutes with Argon. The corresponding peak is quantitated as Oxygen.

Since Nitrogen is used to pressurize samples, the reported Nitrogen values are calculated by adding all the sample components and subtracting from 100%.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	***ASTM D-1946***	***ATL Modifications***
Calibration	A single point calibration is performed using a reference standard closely matching the composition of the unknown.	A minimum of 5-point calibration curve is performed. Quantitation is based on average Response Factor.
Reference Standard	The composition of any reference standard must be known to within 0.01 mol % for any component.	The standards used by ATL are blended to a >/= 95% accuracy.
Sample Injection Volume	Components whose concentrations are in excess of 5 % should not be analyzed by using sample volumes greater than 0.5 mL.	The sample container is connected directly to a fixed volume sample loop of 1.0 mL on the GC. Linear range is defined by the calibration curve. Bags are loaded by vacuum.
Normalization	Normalize the mole percent values by multiplying each value by 100 and dividing by the sum of the original values. The sum of the original values should not differ from 100% by more than 1.0%.	Results are not normalized. The sum of the reported values can differ from 100% by as much as 15%, either due to analytical variability or an unusual sample matrix.
Precision	Precision requirements established at each concentration level.	Duplicates should agree within 25% RPD for detections > 5 X's the RL.

Receiving Notes

The Chain of Custody was missing method information. EATL proceeded with the analysis as per the original contract or verbal agreement.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Seven qualifiers may have been used on the data analysis sheets and indicate as follows:
B - Compound present in laboratory blank greater than reporting limit.
J - Estimated value.
E - Exceeds instrument calibration range.
S - Saturated peak.
Q - Exceeds quality control limits.
U - Compound analyzed for but not detected above the detection limit.
M - Reported value may be biased due to apparent matrix interferences.
File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue
